D. The Contractor shall provide all necessary excavation, sheeting and bracing or other adequate maintenance of excavation banks, suitable runways and ramps as necessary for access of pier drilling, control of ground and surface water as necessary to keep the work area sufficiently dry, suitable access roads for movement of equipment and materials to and from pier locations, field layout required for pier work including setting and maintaining a location stake for each pier and giving cut-off grades on all piers, removal and replacement of all overhead and underground obstructions as required, and coordination of all concrete ordering and delivery.

1.5 QUALIFICATIONS

A. Drilled piers shall be installed by a specialty Contractor with suitable equipment, competent personnel, and a reputation of satisfactorily performing the work. The Contractor shall have a minimum of 5 years successful experience and a minimum of 5 successful installations on projects of a similar size and scope to this project and of using similar installation methods as may be anticipated for this project. Evidence of compliance with this section shall be submitted to the Architect/Engineer prior to entering into a contract for the work.

1.6 SUBMITTALS

A. Concrete Mix Design: Submit concrete mix designs suitable for method of concrete placement for Engineer and Owner's Testing Laboratory approval prior to pier installation. Reference 03 30 00 “Cast in Place Concrete”.

B. Drilling Records: The Contractor and the Contractor’s Geotechnical Engineer shall each submit copies of the drilling record for each pier to the Architect/Engineer immediately after drilling. The reports shall indicate the name of the job, name of Contractor, and name of drilling superintendent. For each pier installed, the report shall indicate the following information:

1. Pier number and location
2. Pier shaft diameter
3. Bottom elevation
4. Top elevation
5. Pier length
6. Theoretical volume of concrete in pier
7. Actual volume of concrete placed
8. Reinforcing steel size and depth actually placed
9. Drilling start and finish time
10. Concreting start and finish time
11. Variation from specified tolerances including surveyed location and plumbness
12. Construction method (dry method, casing method, or slurry displacement method)

13. Groundwater conditions (rate of water infiltration and depth of water in hole prior to concreting for dry piers; water elevation in hole for wet piers)

14. Elevation of top and bottom of any casing left in place

15. Description of temporary or permanent casing (including purpose, diameter, wall thickness and length)

16. Description and elevation of any obstructions encountered and whether removal was obtained

17. Description of pier bottom including amount and extent of loose material

18. Method of concrete placement

19. Any difficulties encountered in drilling or concreting operations

20. Any deviations from specifications.

Reports prepared by the Contractor's Geotechnical Engineer shall be compiled and signed by the Contractor's Geotechnical Engineer. Reports prepared by the Contractor shall be compiled and certified by the Contractor's Geotechnical Engineer.

C. Shop Drawings:

1. Reinforcing Steel: Submit shop drawings for all drilled pier and pier cap reinforcing steel.

2. Installation Method: Submit detailed procedures of the installation method, including (where applicable) type and number of drilling rigs and equipment, casing size and length, casing removal method, drilling fluid type, dewatering method, concrete placement, and reinforcing steel securing and placement.

3. Steel Casings: Submit shop drawings for size, wall thickness, length, and grade of permanent steel casings required. Show all splices and methods of splicing.

4. Contractor's Geotechnical Engineer shall confirm the bearing capacities.

D. Product Data: Submit manufacturer's product data with application and installation instructions for proprietary materials and items.

E. Qualification Data:

1. Submit qualification data for firms and persons specified in the article entitled "Qualifications" to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

2. Submit Welding Procedure Specifications (WPS) in accordance with ANSI/AWS D1.1 for all welded joints in steel casing. Submit test reports showing successful passage of qualification tests for all non-prequalified WPSs.

3. Provide certification that welders to be employed in work have satisfactorily

passed AWS qualification tests as specified in section 1.05-B. If recertification of welders is required, retesting will be at Contractor's responsibility.

F. Equivalent Alternates: The Contractor shall submit his bid based on the specifications as written without exceptions. He may submit bids for alternates to the specifications or modifications to the design, load test program, or installation specifications for consideration by the Owner's Representative and the Owner. All equivalent alternated shall be certified by the Contractor's Geotechnical Engineer and Professional Land Surveyor and shall be submitted in writing to the Engineer of Record for review and acceptance prior to starting construction. All accepted equivalent alternates shall be provided by the contractor without adding costs to the Contractor's accepted contract agreement with the Owner.

G. Post Construction Survey: After completion of pier placement, the Contractor shall provide the Owner's Representative with an as-built survey certified by the Contractor's Geotechnical Engineer and Professional Land Surveyor showing the actual locations of the piers at the top elevations. This survey shall show the plumbness of vertical piers, and all abandoned piers and their replacements. No construction of superstructures shall commence until this survey has been reviewed and accepted by the Owner's Representative. In order to facilitate the progress of the Work, the Contractor shall submit partial pier surveys for approval as the Work proceeds.

1.7 QUALITY ASSURANCE

The Contractor is responsible for quality control, including workmanship and materials furnished by his subcontractors and suppliers.

A. Codes and Standards: The Contractor shall comply with the provisions of the following codes, specifications, and standards, except where more stringent requirements are shown or specified:

1. ACI 336.3R – "Design and Construction of Drilled Piers"
2. ACI 301 - "Specifications for Structural Concrete for Buildings".
3. ACI 117 - "Specifications for Tolerances for Concrete Construction and Materials."
4. ACI 318 - "Building Code Requirements for Reinforced Concrete".
5. Concrete Reinforcing Steel Institute (CRSI), "Manual of Standard Practice".
6. ANSI/AWS D1.1 "Structural Welding Code - Steel".
7. ANSI/AWS D1.4 "Structural Welding Code – Reinforcing Steel".

In addition, all applicable building code and local regulations shall be followed. In case of conflict, the strictest interpretation shall govern.

B. Survey Work:

1. The Contractor shall employ a qualified professional land surveyor to perform all surveys, layouts and measurements for drilled pier work including the layout of anchor rods and/or reinforcing steel dowels embedded in drilled piers. The surveyor shall conduct the layout work for each drilled pier to the lines and levels required prior to beginning excavation and shall make actual in-place measurements of each drilled pier plan location, shaft diameter, bottom and top elevations and deviations from specified tolerances.

2. The surveyor shall record and submit all information pertinent to each drilled pier and cooperate with other testing and inspection personnel to provide data for all required reports.

C. Testing Laboratory Requirements: The Contractor shall cooperate with all testing and inspection personnel employed to perform field quality control tests and inspections. See Testing Laboratory section of the specifications for required tests and inspections to be performed by the Testing Laboratory and Geotechnical Engineer.

Inspection or testing by the Owner does not relieve the Contractor of his responsibility to perform the Work in accordance with the Contract Documents.

1.8 JOB CONDITIONS

A. Site Information:

1. Data on indicated subsurface conditions are not intended as representations or warranties of continuity of such conditions. It is expressly understood that Owner will not be responsible for interpretations or conclusions drawn therefrom by the Contractor. The data are made available for convenience of the Contractor.

2. The Contractor may make additional test borings and other exploratory operations at no additional cost to the Owner.

3. The Contractor shall inspect the site prior to drilling operations and shall determine any constraints to the work presented by the existing surface conditions and report them to the Owner's Representative.

B. Protection of Existing Structures: Locate all existing underground structures and utilities that are to remain in service during construction. Protect above-ground structures, underground utilities and other construction from damage caused by drilling operations. Report any conflicts between drilling work and underground utilities and structures to the Owner's Representative and do not proceed with the work until the conflict is resolved.

C. Survey of Existing Structures: Record and report to Architect/Engineer surveyed elevation benchmarks on structures where directed by the Owner's Representative before commencing work, when structures are adjacent to drilling operations. Record and report elevation of each benchmark at least twice a day while drilling is in progress. Should benchmark readings indicate displacement, halt drilling operations until corrective action

has been provided and is acceptable to the Owner's Representative and the Owner.

1.9 PREINSTALLATION CONFERENCE

A. At least 7 days prior to beginning pier installation, the Contractor shall conduct a meeting to review the proposed excavation, inspection, and concrete and reinforcement placement methods and procedures to produce pier construction of the required quality. Also review requirements for submittals, status of coordinating work and availability of materials. Establish work progress schedule and procedures for bearing surface inspection, materials testing, and certifications. The Contractor shall send a pre- installation conference agenda to all attendees 7 days prior to the scheduled date of the conference.

B. The Contractor shall require responsible representatives of every party who is concerned with the concrete work to attend the conference, including but not limited to the following:

Contractor's Superintendent
Laboratory responsible for field material testing
Drilling Subcontractor
Ready-Mix Concrete Producer
Contractor's Geotechnical Engineer
Owner's and Architect's/Engineer's Representative
Contractor's Professional Land Surveyor

C. Minutes of the meeting shall be recorded, typed and printed by the Contractor and distributed by him to all parties concerned within 5 days of the meeting. One copy of the minutes shall be transmitted to the following for information purposes:

Owner's Representative
Architect
Engineer-of-Record

D. The Engineer shall be present at the conference. The Contractor shall notify the Engineer at least 7 days prior to the scheduled date of the conference.

PART 2 - PRODUCTS

2.1 CONCRETE

Concrete shall be as specified in the "Cast-in-Place Concrete" section of the specifications, in the general notes, and on the drawings, with the additional requirements specified below:

A. Maximum Aggregate Size: Provide maximum aggregate size of three quarters of minimum clear spacing between individual reinforcing bars or bundles of bars, with 1 1/2" maximum.

B. Water Reducing Admixtures: Where required by mix design, use water-reducing admixtures in strict compliance with manufacturers directions. Admixtures to increase cement dispersion, or provide increased workability for low-slump concrete may be used at contractor's option. Use admixtures in the amounts as recommended by manufacturer for climatic conditions prevailing at time of placing concrete. Adjust quantities of admixtures

as required to maintain quality control.

C. Slump Limits: Proportion concrete to have a slump that is suitable for the placement process used. The mix must remain fluid throughout the concrete placement time and during extraction of any temporary casing. Provide a minimum 6" and maximum 9”slump concrete with retarder for temporarily cased piers at time of pulling casing.

2.2 REINFORCING STEEL

A. See "Concrete Reinforcing Steel" section of the specifications.

B. Reinforcing Support and Positioning Devices: Devices made of non-corrosive material that support and align reinforcing steel within the shaft and that provide the appropriate side and bottom cover to the reinforcing steel. Acceptable manufacturers include:

“Pieresearch”
“Aztec, a Dayton-Superior Company” “Foundation Technologies, Inc.”

2.3 STEEL CASING

A. Steel casing shall conform to ASTM A 283, Grade C or ASTM A

36. B. Corrugated steel casing shall conform to ASTM A 929.

2.4 GROUT

A. Grout used for filling annular void outside permanent casings shall be sand cement grout consisting of Portland cement (ASTM C 150 Type I or III), sand (ASTM C 33), and water. Proportions by weight shall be one part cement, 2 1/4 to 2 1/2 parts sand, and the minimum amount of water required to obtain a workable mix but not exceeding a water- cement ratio of 1.0. The grout mix shall be suitable for the method of installation, whether by gravity feed of by pumping under pressure.

2.5 CONCRETE MIXING

A. Ready Mix Concrete: Comply with the requirements of ASTM C94.

B. Hot Weather Concreting: The maximum acceptable concrete temperature at the truck discharge point shall be 95°F. Refer to Hot Weather Concreting Practices specified in "Cast-in-Place Concrete" section of the specifications for required hot weather concreting practices.

C. Cold Weather Concreting Practices: Refer to the "Cast-in-Place Concrete" section of the specifications for cold weather concreting practices and the conditions under which they are to be followed.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Requirements:

1. Excavate holes for drilled piers to dimensions and required bearing strata or elevations as shown on the drawings unless directed otherwise in the field by the Owner's Geotechnical Engineer.

2. Maintain sidewall stability during drilling. If sidewall instability is encountered that the Owner's Representative considers excessive, the Contractor shall use alternate drilling methods such as temporary casing or slurry displacement method.

3. Excavate holes for closely spaced piers and those occurring in fragile or sand stratas only after adjacent holes are filled with concrete and allowed to set a minimum of 6 hours or longer as required for concrete to harden unless temporary casing to maintain sidewall stability is used.

4. Drilled pier design dimensions and depths shown on the drawings shall be considered minimums and are based on bearing and/or friction in assumed strata. If bearing stratum is not capable of maintaining the assumed capacity, the foundation system shall be revised as directed by the Owner's Geotechnical Engineer and Owner's Representative.

5. Remove loose material and free water from the bottom of the shaft. The bearing surface should be essentially flat within a tolerance of 1 vertical to 12 horizontal or with one step that is less than one-quarter of the diameter of the bearing area.

6. Explore the bearing stratum of each pier with a probe hole to a minimum depth equal to the diameter of the bearing area below the bottom of the pier, unless waived by the Contractor's Geotechnical Engineer.

B. Equipment:

1. Provide adequate equipment so work is expedited to the fullest extent possible. Use equipment fully capable of excavating shafts to depths, diameters, and sizes indicated, and within the specified tolerances. Maintain equipment in satisfactory operating condition and provide sufficient quantity of equipment to maintain the projected schedule of the Work.

2. Using bits or augers with a power-driven rotary-type rig, a shaft of a diameter specified on the drawings shall be excavated from the ground surface to a depth as specified on the drawings or as ordered by the Owner's Geotechnical Engineer.

C. Obstructions:

1. Contractor shall be responsible for removal of rocks, boulders, or other unforeseen obstructions are encountered which cannot be removed by standard drilled pier excavation methods, and if such obstructions are not indicated by available sub-

surface data.

2. Remove such obstructions by hand labor using air-powered tools or by other safe methods recognized in the construction industry. Standard drilled pier excavation methods include the use of core barrels with pier drilling equipment.

3.2 DEWATERING

A. Provide and maintain pumping equipment to keep excavations free of water before placing concrete. An excavation is considered dry if the water rises at a rate of less than 1/4 inch per minute and the height of water at the bottom of the pier does not exceed two inches at the time of concrete placement.

B. Dewater in a manner that will not create subsidence or ground loss that might adversely affect the Work or existing adjacent structures. Should the dewatering system employed involve pumping inside the pier, extreme caution shall be used to prevent an unbalanced water head from causing a "blowout", bottom heave, or "quick" condition that could disturb the proposed bearing stratum or surrounding soil strata.

C. The dewatering method shall be submitted for review and approval of the Owner's Geotechnical Engineer.

D. Conduct water to general site run-off ditches and disposal areas with discharge lines. Provide ditching as required to conduct water to site drainage facilities.

E. If excessive water and/or sidewall instability is encountered and drilling operations must be halted, consult with Geotechnical Engineer and Owner’s Representative before using alternate methods of construction.

3.3 TEMPORARY STEEL

CASINGS A. Requirements:

1. Provide temporary casing at locations as directed by the Contractor’s Geotechnical Engineer where the soil will not stand without support or where sloughing of the sides of shafts may seriously delay or endanger the satisfactory completion of excavation and placement of concrete. Also provide temporary casing at locations as directed by the Contractor’s Geotechnical Engineer to seal off the inflow of water into the excavation.

2. The Contractor shall have immediately available for use on the job an ample supply of casing for each size that will be required for use in the shafts and shall provide additional amounts, as required, to ensure the orderly progress of the job.

3. Such casing may be in short pieces but with jointing devices of sufficient strength that assembled sections of casing may be pulled complete as concrete is placed, or immediately thereafter. Provide casing of sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth and/or fluid pressures. Make

diameter of excavation in relation to diameter of casing such as to create a minimum of void space outside of casing. Provide casing with a minimum outside diameter equal to normal outside diameter of drilled foundations.

B. Delivery, Handling, and Storage of Casing

1. Deliver casing to site in undamaged condition.
2. Handle and protect casing to maintain diameter within plus or minus two percent.

C. Casing Withdrawal: Unless otherwise approved by the Contractor's Geotechnical Engineer, all temporary casing shall be removed from shafts as concrete is placed or immediately thereafter, and in such a manner as to prevent sloughing material from dropping to the bottoms of shafts or falling on top of freshly placed concrete. Casings shall be pulled in a single continuous smooth operation without sudden jerks or impact. Maintain head of concrete above the bottom of the casing that exceeds the soil and water pressure at all times during casing withdrawal. Do not vibrate concrete internally before the casing is withdrawn. A vibratory casing extractor may be used. Do not withdraw casing after the concrete has attained initial set. The casing withdrawal and concreting operations shall be observed by the Contractor's Geotechnical Engineer.

3.4 REINFORCING STEEL PLACEMENT

A. Before placing, clean reinforcing steel and dowels of loose rust, scale, dirt, grease and other material that could reduce or destroy bond.

B. Fabricate and erect reinforcing cages in shafts as one continuous unit using inner ring reinforcing guide. Place reinforcement accurately and symmetrically about axis of hole and hold securely in position during concrete placement. The Contractor shall verify depths of drilled piers prior to cutting and tying reinforcing steel cages. Reinforcing steel shall be delivered to the site in standard 60-foot lengths and cut as required. Splice no more than 33% of the bars at any one location, alternating spliced and unspliced bars in a symmetrical pattern. Splices shall be 30 bar diameter compression splices for bars #11 and smaller and mechanical end bearing compression splices for #14 and #18 bars unless noted otherwise on the drawings. See drawings for additional splice information. The Contractor shall be responsible for adding additional reinforcing steel ties or spirals as required to ensure stability of cage and maintenance of shape and configuration as required for proper lifting, handling, and placement.

C. Provide cover to reinforcing steel of not less than 3 inches where exposed to soil and not less than 4 inches in temporarily cased piers. Provide spacer devices to maintain side and bottom cover. Devices shall be installed in accordance with manufacturer's instructions.

D. Permissible reinforcing steel upward vertical movement during casing withdrawal shall be no greater than 6 inches. Downward movement should not exceed 6 inches for every 20 feet of shaft length.

E. Use templates to set anchor bolts, leveling plates and other accessories furnished under work of other sections. The Contractor's Professional Land Surveyor shall determine the plan location and elevation of such devices. Provide spacers (capable of sliding on any

temporary casings required), blocking and holding devices to maintain required position during concrete placement.

F. The General Contractor shall protect exposed ends of dowels and anchor bolts from mechanical damage and exposure to weather by wrapping and taping with polyethylene or other suitable material.

3.5 CONCRETE PLACEMENT

A. General:

1. Fill drilled piers with concrete immediately after inspection and approval by the Contractor's Geotechnical Engineer. Use protection sheets (cut out to receive concrete) over excavation openings, extending at least 12" beyond edge. Complete the excavation and concrete placement in uncased excavations before the end of the workday unless the Architect/Engineer grants permission to do otherwise in writing.

2. Place concrete continuously and in a smooth flow without segregating the mixed materials.

3. Place concrete by means of bottom discharge bucket, flexible drop chute, elephant trunk hopper, concrete pump, or tremie. Free fall of concrete may be used if provided for in concrete mix design and provided it is directed through a hopper or chute such that fall is down center of shaft without hitting sides or reinforcing steel. Free fall of concrete is not permitted for depths greater than the smaller of 20 times the shaft diameter or 60 feet.

4. Place concrete in-the-dry if at all possible. If water occurs, and it is impracticable to dewater drilled pier excavation, and reasonable attempts to seal off water flow have failed, allow water level to attain its normal level and place concrete by tremie method or by concrete pumping. Other methods of depositing concrete underwater may only be used if approved by Architect/Engineer.

5. Stop concrete placement at cut-off elevation shown, screed level, and apply a scoured, rough finish. Where cut-off elevation is above ground elevation, form top section above grade and extend shaft to required elevation.

6. Provide mechanical vibration for consolidation of at least top 5' of each shaft but only after any temporary casing is pulled or when casing is permanent.

7. Interrupted placing operations of over one hour duration will require a cold joint installation as follows. Leave resulting shaft surface approximately level. At resumption of concrete placing, clean off surface laitance, roughen as required, and slush with a 1-to-1 cement grout or commercial bonding agent before remainder of concrete is placed. Intentional cold joints will not be permitted.

8. Concrete shall not be placed in adjacent drilled piers located within three center-to-center shaft diameters of each other until concrete has cured a minimum of 6

hours.

9. Aluminum pipe or equipment shall not be used for placing concrete.

B. Tremie Method:

1. The drilled shafts shall be filled with concrete by the use of a tremie or concrete pump, sealed at the bottom, extending from above the ground surface to the bottom of the drilled shaft. Inspection of the empty tremie on the bottom may be requested of the Contractor by the Owner's authorized inspector. With the sealed tremie on the bottom of the shaft, the tube shall be filled to the top extending above the ground. The filled tremie shall be picked up approximately one (1) foot off the bottom of the shaft to allow the weight of the concrete to displace the seal at the bottom of the tremie. At no time is the tremie to be pulled to such a height as to clear the surface of the concrete already placed in the shaft. All concrete shall be poured through the now open tremie with care taken to maintain a sufficient head of concrete to completely displace all water and suspended cuttings of material and to provide sufficient pressure so as to prevent reduction in pile diameter by earth pressure on the fresh concrete. The concrete in each pile shall be carried above cut-off elevation and then dipped out while fresh to cut-off elevation.

2. All concrete shall be deposited through the tremie or pumpline so as to provide a continuous flow, without aggregate segregation, from bottom to top of pile. The production and delivery of the ready-mixed concrete shall be such that not more than 45 minutes shall elapse between the depositing of successive batches of concrete to ensure a monolithic unit of concrete. No deviation from this method will be acceptable.

3. Should the surface of the concrete in the shaft be breached by the tremie or pumpline, the tube shall immediately be withdrawn from the hole, re-sealed and re-lowered below the surface of the concrete, and pouring operations re-started. Should the Owner's authorized inspector deem it necessary, the Contractor shall instead retrieve the reinforcing steel cage, redrill the shaft to reopen the hole, and begin the concreting operations from the bottom of the pier shaft.

4. If the Contractor’s Geotechnical Engineer has reason to suspect that the concrete was breached by the tremie or pumpline or that the pier, for any other reason, may contain extraneous material or otherwise fail the specifications, he may order the pier cored for inspection and/or testing. If the core recovery and/or test results indicate non-compliance with the specifications, the Contractor shall bear the expense of the investigation and/or testing and shall also, at no cost to the Owner, install proper additional construction as required by the Architect/Engineer.

C. Hot and Cold Weather Placement: Refer to Part II.

3.6 SLURRY DISPLACEMENT METHOD

A. General:

1. The slurry displacement method of construction may be employed only if approved by the Contractor’s Geotechnical Engineer. The excavation shall be carried to final depth with the hole stabilized using drilling fluid of a minimum density acceptable to the Contractor’s Geotechnical Engineer. The drilling fluid may be reused, but it shall be treated, if necessary, to remove the granular material that is in suspension. Care shall be taken in the drilling to avoid caving or sloughing. The bottom of the hole shall be cleaned with a clean-out bucket or other appropriate tool. Type and proposed density of drilling fluid shall be submitted for approval by the Owner's Geotechnical Engineer.

2. Each finished shaft shall consist of a continuous column of concrete extending from the required top elevation to the required bearing surface, having firm contact against the vertical and horizontal surface of the earth surrounding it.

3. Shaft drilling and concrete placement shall be sequenced to prevent damage to adjacent shaft or shaft excavations.

B. Definitions

1. Slurry displacement method (SDM): Drilling, concreting, or drilling and concreting where slurry is used to stabilize the hole. The slurry may be used (a) for the maintenance of the stability of the unlined drilled shaft element; (b) to assist the drilling or insertion of casing as part of the shaft construction; or (c) to allow acceptable concrete placement when water seepage into a drilled shaft is too severe to permit concreting in the "dry."

2. Slurry or drilling fluid - water or prepared drilling mud properly mixed with water.The drilling fluid shall be treated as necessary to conform to the requirements given in Table 1.

3. Mud - pulverized solids used as the basic ingredient for making a water-based slurry.

C. Excavation

1. Shaft excavation shall be to the elevations and to the diameters shown on the Engineer's drawings. Bottom elevations are minimum depths. Shafts may be extended only at the approval of the Owner’s Geotechnical Engineer, based upon written recommendations by the Contractor’s Geotechnical Engineer.

2. Use methods and equipment for shaft excavation that leave the side of the hole and bottom free of loose material that would prevent intimate contact of the concrete with firm, undisturbed soil or rock. If loose or unacceptable material is present, reclean the hole to the satisfaction of the Contractor’s Geotechnical Engineer.

3. Use drilling tools and excavation procedures that minimize excessive negative pressure and avoid disturbance of the surrounding material in the excavations. Raise and lower the drilling tool in the hole at a rate that does not swirl the slurry and affect the stability of the hole.

4. At the completion of excavation and again before the start of concrete placement, clean the drilled-shaft bottom with an air-lift or recirculation system or a cleanout reentering the shaft.

5. For piers designed without end bearing, the accumulated sediment at the bottom of the pier, measured by sounding with a weighted tape just prior to concreting, shall be less than 6 inches. If greater, reclean the hole to the satisfaction of the Contractor’s Geotechnical Engineer.

6. All spoil and excavated materials shall be kept away from each open shaft excavation to avoid contamination of the excavation after final cleanout.

7. Excavated materials shall be stockpiled or disposed of in areas designated by the Owner's representative.

8. Excavated materials temporarily placed at other locations for the convenience of the Contractor will be allowed only with written approval of the Owner's representative and shall finally be removed and placed within designated disposal areas.

D. PROVISIONS FOR OBSERVATION

1. The Contractor shall cooperate with the Owner and design team to ensure the expeditious and safe observation of the shaft excavations.

2. If the Contractor’s Geotechnical Engineer determines that the material at the bottom of any excavation is unsatisfactory, additional excavation or other corrective action shall be made as directed by the Contractor’s Geotechnical Engineer.

3. If additional excavation is required, the shaft bottom shall be drilled again and observed as described above. This procedure shall be repeated until a bearing material is reached that is approved by the Contractor’s Geotechnical Engineer.

E. SLURRY REQUIREMENTS

1. The mud slurry shall consist of a stable colloidal suspension of pulverized solids thoroughly mixed with water so that the properties specified in Table 1 are maintained. Attapulgite and bentonite shall meet API Specification 13A, Section 3, "Oil-Well Drilling-Fluid Material" dated March 1981. The type of mud used will depend on the subsurface conditions and mixing water character. The water used to mix the slurry shall be clean, drinkable, fresh water, obtained from sources approved by the Owner's Representative. Any physical or chemical treatment to the water or slurry that is considered necessary to have the slurry meet

the specifications is the responsibility of the drilled shaft contractor. A written certificate shall be supplied to the Architect/Engineer by the mud supplier specifying the quality and yield for each shipment of mud received. A test report from the supplier giving the physical and chemical properties of the mud shall be supplied to the Architect/Engineer at the start of the work.

2. Water may be used in place of mixed mud slurry, subject to the approval of the Contractor's Geotechnical Engineer on a pier-by-pier basis except for end bearing piers.

3. For shafts with endbearing greater than or equal to 25% of the total allowable capacity as shown on the structural drawings, the mud slurry sand content shall be limited to 4%.

4. The mud slurry shall be mixed in mud tanks on-site or arrive at the site premixed. The mud slurry shall be mixed, stored, and transported using equipment made for these purposes. Combining or mixing slurry in the shaft shall be not permitted.

5. The in-hole slurry shall meet the specifications prior to concreting. Replace or clean, recirculate, and remove sand from, the slurry to maintain the required slurry properties. Recycling of slurry is permitted provided that the recycled slurry satisfies the specified requirements. Submit to the Owner's Representative a written record of test results for each drilled pier.

6. The Contractor shall perform testing of the slurry according to the test methods prescribed in Table 1 and shall record the results for quality control purposes. Provide all field test equipment as required. The drilled-pier contractor shall have available at the site a slurry sampler capable of obtaining slurry samples at any depth within the drilled pier excavation. Slurry shall be sampled and tested in the mud tank and from samples recovered within 1 ft. from the bottom of each drilled shaft.

TABLE 1

SLURRY
SPECIFICATIONS

Item to be Measured	Range of Results at 20°C	Test Method
Density, (pcf)** For slurry 1 ft from pier bottom		ASTM D 4380 (Mud Balance)
Mineral Slurries		
a. No end bearing	85 Max.	
b. With end bearing	70 Max.	
Polymer Slurry	64 Max.	
Marsh Funnel Viscosity, (sec./qt)		API-RP13B-1* Section 2
a. Mineral Slurry	25 to 60	(Marsh funnel)
b. Polymer Slurry	40 to 90	
Sand Content by Volume (%), before concreting, for slurry 1 ft from pier bottom		ASTM D 4381 (Sand screen set)
Mineral Slurries		
a. No end bearing	20 Max.	
b. With end bearing	4 Max.	
Polymer Slurry	1 Max.	
pH, during excavation	7 to 12	ASTM D 4972

* Reference Test Method is American Petroleum Institute (API), Spec. 13B, Eighth Edition, April 1980, issued by American Petroleum Institute - Production Department - 211 N. Ervay, Suite 1700, Dallas, Texas 75201.

** The density of the mud slurry shall not be less than what is needed to drill the shaft.

F. Installation Method

1. Where pre-drilled piers are to be installed below the groundwater level or in caving and sloughing soils, and the procedure is approved by the Contractor's Geotechnical Engineer and the Owner's Representative, use a premixed mud slurry to stabilize the excavation. Maintain the slurry level in the excavation above any unstable zones a sufficient distance to prevent caving or sloughing of those zones but no less than 5 feet above the groundwater level.

2. Set temporary surface casing to contain the slurry, unless waived by the Owner's Representative.

G. Concreting Method

1. Concreting of the drilled pier shall be completed the same day that the excavation is complete. If this is not possible, the excavation will be required to be redrilled, cleaned, and slurry tested before concreting.

2. Place concrete by tremie method or by pumping. Use tremie or pump pipes made of steel and with watertight joints. Use tremie pipe with a minimum diameter of 8 inches or pump pipe with a minimum diameter of 4 inches.

3. Use a capped or pig-plugged tremie or pump pipe inserted and seated in the excavation at the bottom of the pier prior to commencement of the concrete placement.

4. If a capped pipe is used, use tremie or pump pipe with a seal consisting of a bottom plate, or a device acceptable to the Contractor's Geotechnical Engineer, that seals the bottom of the pipe until the pipe reaches the hole bottom. Place enough concrete in the pipe to prevent the flow of slurry into the tremie pipe when it is lifted off the bottom.

5. If a plug is used, set the open tremie pipe loosely on the bottom. Insert the pig at the top and then place concrete pushing the plug ahead, separating the concrete from the slurry. Take care to ensure that the plug is properly sized to fit in the pipe, and keep the concrete separate from the slurry so that all slurry is expelled from the pipe during the initial charging process. When the pipe is fully filled with concrete, lift the pipe off the bottom the minimum amount needed to start the concrete flowing. Once concrete flow has started, place concrete into tremie at a fast enough rate to maintain a positive head of concrete inside pipe relative to slurry level outside pipe.

6. Embed tremie of pump pipe sufficiently in concrete to maintain seal throughout concrete placement to prevent re-entry of slurry suspension into the pipe. Provide minimum embedment of 5 feet. If the seal is lost, withdraw pipe, replace the seal, and re-start tremie using a capped tremie or capped pump pipe.

7. Displace out of the pier or remove from the pier the first portion of concrete that

comes to the top of the pier that contains concrete contaminated with slurry until acceptable concrete is visible. Add or remove concrete to specified cutoff level.

8. Raise or lower the tremie pipe in an acceptable manner that does not break the seal and does not cause channelization or segregation.

9. Pump the displaced slurry to holding tanks. Do not allow slurry to spill onto or contaminate the site. Do not use excavated slurry pits, unless accepted by the Owner's Representative.

3.7 CONSTRUCTION TOLERANCES

A. Plan Location: The tolerance on plan location for the top of the drilled pier shall not be more than 1/24 of the pier diameter or 3" in any direction, whichever is less. If the as-installed shaft is larger than required, the center of the shaft may be taken as the center of a shaft having the required area that lies wholly within the as-installed shaft.

B. Plumbness: Permissible tolerance for plumbness shall be 1.5% of the length. The centers of the top and bottom may be taken as the center of the required area that lies wholly within the as-installed area.

C. Bottom Area: The bottom of the pier shall be essentially horizontal within a tolerance of 1 vertical to 12 horizontal with the area of the bottom bearing not less than 98% of that specified on the drawings.

D. Top Area: The Contractor shall remove excess concrete at the top of the pier beyond the limits of the pier diameter. The pier top diameter shall be the same diameter as the shaft below. Piers extending above the ground surface shall be formed.

E. Concrete Cut-Off Elevation: Concrete cut-off elevation at the pier top shall be plus one inch to minus three inches.

F. Battered Piers: Battered piers shall be installed within 5% of the length from the specified inclination.

G. Anchorage Embedment Tolerance: Vertical and horizontal deviation from design location for individual anchorage components embedded in the pier shall not exceed ± 0.5 inches.

H. If any of the above tolerances are exceeded, the Architect/Engineer shall immediately be notified to evaluate the eccentricity in the pier and recommend corrective measures. The cost of re-engineering and corrective construction shall be borne by the Contractor.

3.8 PERMANENT STEEL CASINGS

A. Requirement: Provide permanent steel casings where shown on the drawings of sufficient strength to withstand handling stresses, concrete pressure, and surrounding earth and/or fluid pressures. Provide casings with minimum outside diameter equal to nominal outside diameter of shaft. Wall thickness shown on the drawings is a minimum required for design

purposes. The Contractor is responsible for increasing thickness as required for the installation process.

B. Steel Pipe Casings: Provide steel pipe casings as shown on the drawings delivered in sections of any convenient length. Connect sections by continuous complete penetration welds performed according to AWS standards by certified welders during placement into drilled pier shaft excavation. Splice location and details shall be submitted for approval on steel pipe casing shop drawings. Design bottom edge of lowest casing section to provide cutting shoe for penetrating into rock strata and affecting water seal.

C. Corrugated Steel Casings: Provide corrugated steel casings formed of galvanized or bituminous-coated steel sheets. Corrugated steel casings may be delivered in any convenient section of panel, with sections or panels field connected in accordance with manufacturer's instructions.

D. Installation: Install permanent steel casing as excavation work progresses to ensure stability of drilled pier shaft walls. Remove and replace or repair casings which are damaged during installation and which could impair strength or efficiency of completed drilled pier.

E. Fill the void space between permanent casing and shaft excavation or between permanent liner and temporary casing with fluid grout by means of grout pipe and pump pressure as required to achieve uniform void filling.

3.9 INSPECTIONS AND TESTS FOR DRILLED PIER EXCAVATIONS

A. Verification of Design: Bottom elevations, bearing and/or skin friction capacities and lengths of drilled piers as shown on the drawings are estimated from available subsurface data. Actual elevations, pier lengths, and bearing and/or skin friction capacities will be determined by the Contractor’s Geotechnical Engineer from conditions found in the excavations.

For piers bearing on rock, a rock core shall be taken for a depth equal to one pier diameter below the bottom of the pier for observation and possible testing by the Contractor’s Geotechnical Engineer to confirm rock quality below the bearing elevation.

B. Notification of Architect/Engineer: If field conditions differ from the data and design recommendations outlined in the Geotechnical Report, the Contractor’s Geotechnical Engineer shall notify the Architect/Engineer immediately.

C. Additional Tests: Additional tests may be required by the Contractor’s Geotechnical Engineer to determine new design criteria. Such tests shall be made as quickly as possible so as not to delay the concreting operations any longer than absolutely required.

D. Observation Requirements: Each drilled pier shall be inspected by the authorized inspector and approved prior to placement of concrete.

E. Cooperation with Testing and Inspection Personnel: The Contractor shall provide facilities as required to assist in the inspection and testing of the excavations, and cooperate with the inspecting and testing personnel to expedite the work.

F. Notification of Observer: The Contractor shall notify the authorized observer at least twelve hours prior to the time the excavation will be ready for inspection. Drilled shaft installation shall not proceed without the authorized observer on site.

END OF SECTION 31 63 29

SECTION 32 12 16 - ASPHALT PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Warm-mix asphalt paving.
2. Warm-mix asphalt overlay.
3. Cold milling of existing asphalt pavement.
4. Warm-mix asphalt patching.

B. Related Requirements:

1. Section 312000 "Earth Moving - Site" for subgrade preparation, fill material, separation geotextiles, unbound-aggregate subbase and base courses, and aggregate pavement shoulders.
2. Section 321313 "Concrete Paving" for concrete pavement and for separate concrete curbs, gutters, and driveway aprons.
3. Section 321373 "Concrete Paving Joint Sealants" for joint sealants and fillers at pavement terminations.
4. New York State Department of Transportation (NYSDOT) standard specification adopted May 1, 2025 and all section and articles reference thereto and as amended.
5. City of Buffalo Department of Public Works Division of Engineering: Standards and Specifications for Construction and Materials, dated January 1, 1988 and all sections and articles reference thereto and as amended.

1.3 ACTION SUBMITTALS

A. Product Data: Include technical data and tested physical and performance properties.

1. Herbicide.
2. Joint sealant.

B. Warm-Mix Asphalt Designs:

1. Certification, by authorities having jurisdiction, of approval of each warm-mix asphalt design proposed for the Work.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For paving-mix manufacturer.

B. Material Certificates: Include statement that mixes containing recycled materials will perform equal to mixes produced from all new materials.

1. Aggregates.
2. Asphalt binder.
3. Asphalt cement.
4. Cutback prime coat.
5. Emulsified asphalt prime coat.
6. Tack coat.
7. Fog seal.
8. Undersealing asphalt.

C. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: A paving-mix manufacturer registered with and approved by NYSDOT.

B. Testing Agency Qualifications: Qualified in accordance with ASTM D3666 for testing indicated.

C. Regulatory Requirements: Comply with materials, workmanship, and other applicable requirements of NYSDOT for asphalt paving work.

1.6 FIELD CONDITIONS

A. Environmental Limitations: Do not apply asphalt materials if subgrade is wet or excessively damp, if rain is imminent or expected before time required for adequate cure, or if the following conditions are not met:

1. Prime Coat: Minimum surface temperature of 60 deg F.
2. Tack Coat: Minimum surface temperature of 60 deg F.
3. Slurry Coat: Comply with weather limitations in ASTM D3910.
4. Asphalt Base Course and Binder Course: Minimum surface temperature of 40 deg F and rising at time of placement.
5. Asphalt Surface Course: Minimum surface temperature of 50 deg F at time of placement.

PART 2 - PRODUCTS

2.1 AGGREGATES

A. General: Use materials and gradations that have performed satisfactorily in previous installations.

B. Coarse Aggregate: Meeting NYSDOT 703-02, sound, angular crushed stone, crushed gravel.

C. Fine Aggregate: Meeting NYSDOT 703-01, sharp-edged natural sand and sand prepared from stone, gravel, cured blast furnace slag, or combination of thereof.

1. For warm-mix asphalt, limit natural sand to a maximum of 10 percent by weight of the total aggregate mass.

2.2 ASPHALT MATERIALS

A. Asphalt Top Course: Meeting NYSDOT 9.5 F2 Top Course WMA, 80 series compaction

B. Asphalt Binder Course: Meeting NYSDOT 19 F9 Binder Course WMA, 80 series compaction.

C. Asphalt Cement: Meeting NYSDOT Table 702-2 Miscellaneous Asphalt Cement.

D. Tack Coat: ASTM D977 emulsified asphalt, or ASTM D2397 cationic emulsified asphalt, slow setting, diluted in water, of suitable grade and consistency for application.

E. Water: Potable.

2.3 AUXILIARY MATERIALS

A. Recycled Materials for Warm-Mix Asphalt Mixes: Reclaimed asphalt pavement; reclaimed, unbound-aggregate base material; and recycled glass from sources and gradations that have performed satisfactorily in previous installations, equal to performance of required warm-mix asphalt paving produced from all new materials.

B. Herbicide: Commercial chemical for weed control, registered by the EPA, and not classified as "restricted use" for locations and conditions of application. Provide in granular, liquid, or wettable powder form.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that subgrade is dry and in suitable condition to begin paving.

B. Proceed with paving only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Protection: Provide protective materials, procedures, and worker training to prevent asphalt materials from spilling, coating, or building up on curbs, driveway aprons, manholes, and other surfaces adjacent to the Work.

B. Proof-roll subgrade below pavements with heavy pneumatic-tired equipment to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.

1. Completely proof-roll subgrade in one direction. Limit vehicle speed to 3 mph.
2. Proof-roll with a loaded 10-wheel, tandem-axle dump truck weighing not less than 15 tons.
3. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by Owner’s Testing Agency, and replace with compacted backfill or fill as directed.

3.3 COLD MILLING

A. Clean existing pavement surface of loose and deleterious material immediately before cold milling. Remove existing asphalt pavement by cold milling to grades and cross sections indicated.

1. Mill to a depth of 1-1/2 inches.
2. Mill to a uniform finished surface free of excessive gouges, grooves, and ridges.
3. Control rate of milling to prevent tearing of existing asphalt course.
4. Repair or replace curbs, driveway aprons, manholes, and other construction damaged during cold milling.
5. Excavate and trim unbound-aggregate base course, if encountered, and keep material separate from milled warm-mix asphalt.
6. Patch surface depressions deeper than 1 inch after milling, before wearing course is laid.
7. Keep milled pavement surface free of loose material and dust.
8. Do not allow milled materials to accumulate on-site.

3.4 SURFACE PREPARATION

A. Ensure that prepared subgrade has been proof-rolled and is ready to receive paving. Immediately before placing asphalt materials, remove loose and deleterious material from substrate surfaces.

B. Herbicide Treatment: Apply herbicide in accordance with manufacturer's recommended rates and written application instructions. Apply to dry, prepared subgrade or surface of compacted-aggregate base before applying paving materials.

C. Tack Coat: Apply uniformly to surfaces of existing pavement at a rate of 0.05 to 0.15 gal./sq. yd..

1. Allow tack coat to cure undisturbed before applying warm-mix asphalt paving.
2. Avoid smearing or staining adjoining surfaces, appurtenances, and surroundings. Remove spillages and clean affected surfaces.

3.5 Warm-MIX ASPHALT PLACEMENT

A. Machine place warm-mix asphalt on prepared surface, spread uniformly, and strike off. Place asphalt mix by hand in areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.

1. Place warm-mix asphalt binder course in single lifts.
2. Place warm-mix asphalt surface course in single lift.
3. Spread mix at a minimum temperature of 250 deg F.
4. Begin applying mix along centerline of crown for crowned sections and on high side of one-way slopes unless otherwise indicated.
5. Regulate paver machine speed to obtain smooth, continuous surface free of pulls and tears in asphalt-paving mat.

B. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.

1. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips. Overlap mix placement about 1 to 1-1/2 inches from strip to strip to ensure proper compaction of mix along longitudinal joints.
2. Complete a section of asphalt base course and binder course before placing asphalt surface course.

C. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with warm-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.6 JOINTS

A. Construct joints to ensure a continuous bond between adjoining paving sections. Construct joints free of depressions, with same texture and smoothness as other sections of warm-mix asphalt course.

1. Clean contact surfaces and apply tack coat to joints.
2. Offset longitudinal joints, in successive courses, a minimum of 6 inches.
3. Offset transverse joints, in successive courses, a minimum of 24 inches.
4. Construct transverse joints at each point where paver ends a day's work and resumes work at a subsequent time. Construct these joints using either "bulkhead" or "papered" method in accordance with AI MS-22, for both "Ending a Lane" and "Resumption of Paving Operations."
5. Compact joints as soon as warm-mix asphalt will bear roller weight without excessive displacement.
6. Compact asphalt at joints to a density within 2 percent of specified course density.

3.7 COMPACTION

A. General: Begin compaction as soon as placed warm-mix paving will bear roller weight without excessive displacement. Compact warm-mix paving with hot hand tampers or with vibratory-plate compactors in areas inaccessible to rollers.

1. Complete compaction before mix temperature cools to 230 deg F.

B. Breakdown Rolling: Complete breakdown or initial rolling immediately after rolling joints and outside edge. Examine surface immediately after breakdown rolling for indicated crown, grade, and smoothness. Correct laydown and rolling operations to comply with requirements.

C. Intermediate Rolling: Begin intermediate rolling immediately after breakdown rolling while warm-mix asphalt is still hot enough to achieve specified density. Continue rolling until warm-mix asphalt course has been uniformly compacted to the following density:

1. Average Density, Marshall Test Method: 96 percent of reference laboratory density in accordance with ASTM D6927, but not less than 94 percent or greater than 100 percent.

D. Finish Rolling: Finish roll paved surfaces to remove roller marks while warm-mix asphalt is still warm.

E. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while asphalt is still hot; compact thoroughly.

F. Repairs: Remove paved areas that are defective or contaminated with foreign materials and replace with fresh, warm-mix asphalt. Compact by rolling to specified density and surface smoothness.

G. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened.

H. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.8 INSTALLATION TOLERANCES

A. Pavement Thickness: Compact each course to produce thickness indicated within the following tolerances:

1. Base Course and Binder Course: Plus or minus 1/2 inch.
2. Surface Course: Plus 1/4 inch, no minus.

B. Pavement Surface Smoothness: Compact each course to produce surface smoothness within the following tolerances as determined by using a 10-foot straightedge applied transversely or longitudinally to paved areas:

1. Base Course and Binder Course: 1/4 inch.
2. Surface Course: 1/8 inch.
3. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template is 1/4 inch.

3.9 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Thickness: In-place compacted thickness of warm-mix asphalt courses will be determined in accordance with ASTM D3549.

C. Surface Smoothness: Finished surface of each warm-mix asphalt course will be tested for compliance with smoothness tolerances.

D. In-Place Density: Testing agency will take samples of uncompacted paving mixtures and compacted pavement in accordance with ASTM D979.

1. Reference maximum theoretical density will be determined by averaging results from four samples of warm-mix asphalt-paving mixture delivered daily to site, prepared in accordance with ASTM D2041, and compacted in accordance with job-mix specifications.
2. In-place density of compacted pavement will be determined by testing core samples in accordance with ASTM D1188 or ASTM D2726.

    a. One core sample will be taken for every 10,000 sq. ft. or less of installed pavement, with no fewer than three cores taken.
    b. Field density of in-place compacted pavement may also be determined by nuclear method in accordance with ASTM D2950 and coordinated with ASTM D1188 or ASTM D2726.

E. Replace and compact warm-mix asphalt where core tests were taken.

F. Remove and replace or install additional warm-mix asphalt where test results or measurements indicate that it does not comply with specified requirements.

3.10 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 321216

SECTION 32 13 13 – CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes Concrete Paving**:**

1. Concrete pavements
2. Curbs and gutters.
3. Sidewalks, walkways.

B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for general building applications of concrete.
2. Section 321373 "Concrete Paving Joint Sealants" for joint sealants in expansion and contraction joints within concrete paving and in joints between concrete paving and asphalt paving or adjacent construction.
3. Section 321723 "Pavement Markings."
4. Section 321726 "Tactile Warning Surfacing".
5. New York State Department of Transportation (NYSDOT) standard specification adopted January 1, 2020 and all section and articles reference thereto and as amended.
6. City of Buffalo Department of Public Works Division of Engineering: Standards and Specifications for Construction and Materials, dated January 1, 1988 and all sections and articles reference thereto and as amended.

1.3 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash, slag cement, and other pozzolans.

B. W/C Ratio: The ratio by weight of water to cementitious materials.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Design Mixtures: For each concrete paving mixture. Include alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified ready-mix concrete manufacturer.

B. Material Certificates: For the following, from manufacturer:

1. Cementitious materials.
2. Steel reinforcement and reinforcement accessories.
3. Fiber reinforcement.
4. Admixtures.
5. Curing compounds.
6. Applied finish materials.
7. Bonding agent or epoxy adhesive.
8. Joint fillers.

C. Material Test Reports: For each of the following:

1. Aggregates: Include service-record data indicating absence of deleterious expansion of concrete due to alkali-aggregate reactivity.

D. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C94 requirements for production facilities and equipment.

1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities" (Quality Control Manual - Section 3, "Plant Certification Checklist").

1.7 FIELD CONDITIONS

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

B. Cold-Weather Concrete Placement: Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing, or low temperatures. Comply with ACI 306.1 and the following:

1. When air temperature has fallen to or is expected to fall below 40 deg F, uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 deg F and not more than 80 deg F at point of placement.
2. Do not use frozen materials or materials containing ice or snow.
3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in design mixtures.

C. Hot-Weather Concrete Placement: Comply with ACI 301 and as follows when hot-weather conditions exist:

1. Cool ingredients before mixing to maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated in total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
2. Cover steel reinforcement with water-soaked burlap, so steel temperature will not exceed ambient air temperature immediately before embedding in concrete.
3. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, soft spots, or dry areas.

PART 2 - PRODUCTS

2.1 CONCRETE, GENERAL

A. ACI Publications: Comply with ACI 301 unless otherwise indicated.

2.2 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, and smooth exposed surfaces.

1. Use flexible or uniformly curved forms for curves with a radius of 100 feet or less.

B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces.

2.3 STEEL REINFORCEMENT

A. Plain-Steel Welded-Wire Reinforcement: ASTM A185, fabricated from as-drawn steel wire into flat sheets.

B. Plain-Steel Wire: ASTM A1064, as drawn.

C. Joint Dowel Bars: ASTM A615, Grade 60 plain-steel bars. Cut bars true to length with ends square and free of burrs.

D. Tie Bars: ASTM A615, Grade 60; deformed.

E. Hook Bolts: ASTM A307, Grade A, internally and externally threaded. Design hook-bolt joint assembly to hold coupling against paving form and in position during concreting operations, and to permit removal without damage to concrete or hook bolt.

F. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded-wire reinforcement, and dowels in place. Manufacture bar supports

according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete specified, and as follows:

1. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.

2.4 CONCRETE MATERIALS

A. Cementitious Materials: Use the following cementitious materials, of same type, brand, and source throughout Project:

1. Portland Cement: ASTM C150/C150M, gray portland cement Type I or Type II.
2. Fly Ash: ASTM C618, Class C or Class F.

B. Normal-Weight Aggregates: ASTM C33/C33M, Class 4S, uniformly graded. Provide aggregates from a single source.

1. Maximum Coarse-Aggregate Size: #57.
2. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.

C. Air-Entraining Admixture: ASTM C260/C260M.

D. Chemical Admixtures: Admixtures certified by manufacturer to be compatible with other admixtures and to contain not more than 0.1 percent water-soluble chloride ions by mass of cementitious material.

1. Water-Reducing Admixture: ASTM C494, Type A.
2. Retarding Admixture: ASTM C494, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C494, Type D.
4. High-Range, Water-Reducing Admixture: ASTM C494, Type F.
5. High-Range, Water-Reducing and Retarding Admixture: ASTM C494, Type G.
6. Plasticizing and Retarding Admixture: ASTM C1017, Type II.

E. Water: Potable and complying with ASTM C94.

2.5 FIBER REINFORCEMENT

A. Synthetic Fiber: Monofilament polypropylene fibers engineered and designed for use in decorative concrete paving, complying with ASTM C1116/C1116M, Type III, 1/2 to 1-1/2 inches long.

2.6 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 3, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd..

B. Moisture-Retaining Cover: ASTM C171, polyethylene film or white burlap-polyethylene sheet.

C. Water: Potable.

D. Evaporation Retarder: Waterborne, monomolecular, film forming, manufactured for application to fresh concrete.

E. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C309, Type 1, Class B, dissipating.

2.7 RELATED MATERIALS

A. Joint Fillers: ASTM D1751, asphalt-saturated cellulosic fiber in preformed strips.

B. Bonding Agent: ASTM C1059/C1059M, Type II, non-redispersible, acrylic emulsion or styrene butadiene.

2.8 CONCRETE MIXTURES

A. Prepare design mixtures, proportioned according to ACI 301, for each type and strength of normal-weight concrete, and as determined by either laboratory trial mixtures or field experience.

1. Use a qualified independent testing agency for preparing and reporting proposed concrete design mixtures for the trial batch method.
2. When automatic machine placement is used, determine design mixtures and obtain laboratory test results that comply with or exceed requirements.

B. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows:

1. Combined Fly Ash or Pozzolan, and Slag Cement: 50 percent, with fly ash or pozzolan not exceeding 25 percent.

C. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight concrete at point of placement having an air content as follows:

1. Air Content: 6 percent plus or minus 1-1/2 percent for #57 maximum aggregate size.

D. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

E. Chemical Admixtures: Use admixtures according to manufacturer's written instructions.

1. Use high-range, water-reducing and retarding admixture in concrete as required for placement and workability.
2. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.

F. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd..

G. Concrete Mixtures: Normal-weight concrete.

1. Compressive Strength (28 Days): **5000 psi.**
2. Maximum W/C Ratio at Point of Placement: 0.40.
3. Slump Limit: 4 inches, plus or minus 1 inch.
4. Maximum Coarse Aggregate Size, ASTM C33: #57.
5. Air Content: 6%, plus or minus 1-1/2%.

2.9 CONCRETE MIXING

A. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to ASTM C94 and ASTM C1116. Furnish batch certificates for each batch discharged and used in the Work.

1. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine exposed subgrades and subbase surfaces for compliance with requirements for dimensional, grading, and elevation tolerances.

B. Proof-roll prepared subbase surface below concrete paving to identify soft pockets and areas of excess yielding.

1. Completely proof-roll subbase in one direction. Limit vehicle speed to 3 mph.
2. Proof-roll with a pneumatic-tired and loaded, 10-wheel, tandem-axle dump truck weighing not less than 15 tons.
3. Correct subbase with soft spots and areas of pumping or rutting exceeding depth of 1/2 inch according to requirements in Section 312000 "Earth Moving - Site."

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove loose material from compacted subbase surface immediately before placing concrete.

3.3 EDGE FORMS AND SCREED CONSTRUCTION

A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides to required lines, grades, and elevations. Install forms to allow continuous progress of work and so forms can remain in place at least 24 hours after concrete placement.

B. Clean forms after each use and coat with form-release agent to ensure separation from concrete without damage.

3.4 STEEL REINFORCEMENT INSTALLATION

A. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

B. Clean reinforcement of loose rust and mill scale, earth, ice, or other bond-reducing materials.

C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.

D. Install welded-wire reinforcement in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

3.5 JOINTS

A. General: Form construction, isolation, and contraction joints and tool edges true to line, with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline unless otherwise indicated.

1. When joining existing paving, place transverse joints to align with previously placed joints unless otherwise indicated.

B. Construction Joints: Set construction joints at side and end terminations of paving and at locations where paving operations are stopped for more than one-half hour unless paving terminates at isolation joints.

1. Continue steel reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of paving strips unless otherwise indicated.
2. Butt Joints: Use bonding agent at joint locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
3. Keyed Joints: Provide preformed keyway-section forms or bulkhead forms with keys unless otherwise indicated. Embed keys at least 1-1/2 inches into concrete.
4. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.

C. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, other fixed objects, and where indicated.

1. Locate expansion joints at intervals of 60 feet unless otherwise indicated.
2. Extend joint fillers full width and depth of joint.
3. Terminate joint filler not less than 1/2 inch or more than 1 inch below finished surface if joint sealant is indicated.
4. Furnish joint fillers in one-piece lengths. Where more than one length is required, lace or clip joint-filler sections together.
5. During concrete placement, protect top edge of joint filler with metal, plastic, or other temporary preformed cap. Remove protective cap after concrete has been placed on both sides of joint.

D. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of the concrete thickness, as follows:

1. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.

2. Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or coat with asphalt one-half of dowel length to prevent concrete bonding to one side of joint.

E. Edging: After initial floating, tool edges of paving, gutters, curbs, and joints in concrete with an edging tool to a 1/4-inch radius. Repeat tooling of edges after applying surface finishes. Eliminate edging-tool marks on concrete surfaces.

3.6 CONCRETE PLACEMENT

A. Before placing concrete, inspect and complete formwork installation, steel reinforcement, and items to be embedded or cast-in.

B. Remove snow, ice, or frost from subbase surface and steel reinforcement before placing concrete. Do not place concrete on frozen surfaces.

C. Moisten subbase to provide a uniform dampened condition at time concrete is placed. Do not place concrete around manholes or other structures until they are at required finish elevation and alignment.

D. Comply with ACI 301 requirements for measuring, mixing, transporting, and placing concrete.

E. Do not add water to fresh concrete after testing.

F. Deposit and spread concrete in a continuous operation between transverse joints. Do not push or drag concrete into place or use vibrators to move concrete into place.

G. Consolidate concrete according to ACI 301 by mechanical vibrating equipment supplemented by hand spading, rodding, or tamping.

1. Consolidate concrete along face of forms and adjacent to transverse joints with an internal vibrator. Keep vibrator away from joint assemblies**,** reinforcement, or side forms. Use only square-faced shovels for hand spreading and consolidation. Consolidate with care to prevent dislocating reinforcement and joint devices.

H. Screed paving surface with a straightedge and strike off.

I. Commence initial floating using bull floats or darbies to impart an open-textured and uniform surface plane before excess moisture or bleedwater appears on the surface. Do not further disturb concrete surfaces before beginning finishing operations or spreading surface treatments.

J. Curbs and Gutters: Use design mixture for automatic machine placement. Produce curbs and gutters to required cross section, lines, grades, finish, and jointing.

3.7 FLOAT FINISHING

A. General: Do not add water to concrete surfaces during finishing operations.

B. Float Finish: Begin the second floating operation when bleedwater sheen has disappeared and concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots and fill low spots. Refloat surface immediately to uniform granular texture.

1. Medium-to-Fine-Textured Broom Finish: Draw a soft-bristle broom across float-finished concrete surface, perpendicular to line of traffic, to provide a uniform, fine-line texture.

3.8 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.

B. Comply with ACI 306.1 for cold-weather protection.

C. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete but before float finishing.

D. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.

E. Curing Methods: Cure concrete by moisture-retaining-cover curing, curing compound or a combination of these as follows:

1. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Immediately repair any holes or tears occurring during installation or curing period, using cover material and waterproof tape.
2. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.

3.9 PAVING TOLERANCES

A. Comply with tolerances in ACI 117 and as follows:

1. Elevation: 3/4 inch.

2. Thickness: Plus 3/8 inch, minus 1/4 inch.
3. Surface: Gap below 10-feet-long; unleveled straightedge not to exceed 1/2 inch.
4. Lateral Alignment and Spacing of Dowels: 1 inch.
5. Vertical Alignment of Dowels: 1/4 inch.
6. Joint Spacing: 3 inches.
7. Contraction Joint Depth: Plus 1/4 inch, no minus.
8. Joint Width: Plus 1/8 inch, no minus.

3.10 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Testing Services: Testing and inspecting of composite samples of fresh concrete obtained according to ASTM C172 shall be performed according to the following requirements:

1. Testing Frequency: Obtain at least one composite sample for each 5000 sq. ft. or fraction thereof of each concrete mixture placed each day.

    a. When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

2. Slump: ASTM C143; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
3. Air Content: ASTM C231, pressure method; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
4. Concrete Temperature: ASTM C1064; one test hourly when air temperature is 40 deg F and below and when it is 80 deg F and above, and one test for each composite sample.
5. Compression Test Specimens: ASTM C31; cast and laboratory cure one set of at least four standard cylinder specimens for each composite sample.
6. Compressive-Strength Tests: ASTM C39; test one specimen at seven days and two specimens at 28 days.

    a. A compressive-strength test shall be the average compressive strength from two specimens obtained from same composite sample and tested at 28 days.

C. Strength of each concrete mixture will be satisfactory if average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi.

D. Test results shall be reported in writing to Architect, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.

E. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.

F. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect.

G. Concrete paving will be considered defective if it does not pass tests and inspections.

H. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

I. Prepare test and inspection reports.

3.11 REPAIR AND PROTECTION

A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Architect.

B. Drill test cores, where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.

C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.

D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

3.12 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 321313

SECTION 32 13 73 - CONCRETE PAVING JOINT SEALANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cold-applied joint sealants.
2. Joint-sealant backer materials.
3. Primers.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.

B. Product Testing: Test joint sealants using a qualified testing agency.

1.5 FIELD CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.
2. When joint substrates are wet.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.

2.2 COLD-APPLIED JOINT SEALANTS

A. Single-Component, Self-Leveling, Silicone Joint Sealant: ASTM D5893, Type SL.

1. DOWSIL 756 SMS Building Sealant as manufactured by The Dow Chemical Company or approved equivalent.

2.3 JOINT-SEALANT BACKER MATERIALS

A. Joint-Sealant Backer Materials: Nonstaining; compatible with joint substrates, sealants, primers, and other joint fillers; and approved for applications indicated by joint-sealant manufacturer, based on field experience and laboratory testing.

2.4 PRIMERS

A. Primers: Product recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Before installing joint sealants, clean out joints immediately to comply with joint-sealant manufacturer's written instructions.

1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

B. Joint Priming: Prime joint substrates where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

3.3 INSTALLATION OF JOINT SEALANTS

A. Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated unless more stringent requirements apply.

B. Joint-Sealant Installation Standard: Comply with recommendations in ASTM C1193 for use of joint sealants as applicable to materials, applications, and conditions.

C. Install joint-sealant backings to support joint sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of joint-sealant backings.
2. Do not stretch, twist, puncture, or tear joint-sealant backings.
3. Remove absorbent joint-sealant backings that have become wet before sealant application and replace them with dry materials.

D. Install joint sealants immediately following backing installation, using proven techniques that comply with the following:

1. Place joint sealants so they fully contact joint substrates.
2. Completely fill recesses in each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

E. Provide joint configuration to comply with joint-sealant manufacturer's written instructions unless otherwise indicated.

3.4 CLEANING AND PROTECTION

A. Clean off excess joint sealant as the Work progresses, by methods and with cleaning materials approved in writing by joint-sealant manufacturers.

B. Protect joint sealants, during and after curing period, from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately and replace with joint sealant so installations in repaired areas are indistinguishable from the original work.

3.5 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 321373

SECTION 32 17 23 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Painted markings applied to asphalt paving.
2. Painted markings applied to concrete surfaces.

1.3 ACTION SUBMITTALS

A. Product Data: Include technical data and tested physical and performance properties.

1. Pavement-marking paint, acrylic.

1.4 QUALITY ASSURANCE

A. Regulatory Requirements: Comply with materials, workmanship, and other applicable requirements of City of Buffalo for pavement-marking work.

1. Measurement and payment provisions and safety program submittals included in standard specifications do not apply to this Section.

1.5 FIELD CONDITIONS

A. Environmental Limitations: Proceed with pavement marking only on clean, dry surfaces and at a minimum ambient or surface temperature of 55 deg F for water-based materials, and not exceeding 95 deg F.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Source Limitations: Obtain pavement-marking paints from single source from single manufacturer.

2.2 PAVEMENT-MARKING PAINT

A. Pavement-Marking Paint, Acrylic: Acrylic, waterborne emulsion, lead and chromate free, ready mixed, complying with FS TT-P-1952F, Type II, with drying time of less than three minutes.

1. Color: White.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that pavement-marking substrate is dry and in suitable condition to begin pavement marking in accordance with manufacturer's written instructions.

B. Proceed with pavement marking only after unsatisfactory conditions have been corrected.

3.2 PAVEMENT MARKING

A. Do not apply pavement-marking paint until layout, colors, and placement have been verified with Architect.

B. Allow asphalt paving or concrete surfaces to age for a minimum of 30 days before starting pavement marking.

C. Sweep and clean surface to eliminate loose material and dust.

D. Apply paint with mechanical equipment to produce pavement markings, of dimensions indicated, with uniform, straight edges. Apply at manufacturer's recommended rates to provide a minimum wet film thickness of 15 mils.

3.3 PROTECTING AND CLEANING

A. Protect pavement markings from damage and wear during remainder of construction period.

B. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

3.4 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 321723

SECTION 32 17 26 - TACTILE WARNING SURFACING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cast-in-place detectable warning tiles.

B. Related Requirements:

1. Section 321313 "Concrete Paving" for concrete walkways serving as substrates for tactile warning surfacing.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For tactile warning surfacing, to include in maintenance manuals.

1.5 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of tactile warning surfaces that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Deterioration of finishes beyond normal weathering and wear.
b. Separation or delamination of materials and components.

2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 TACTILE WARNING SURFACING, GENERAL

A. Accessibility Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities for tactile warning surfaces.

1. For tactile warning surfaces composed of multiple units, provide units that when installed provide consistent side-to-side and end-to-end dome spacing that complies with requirements.

B. Source Limitations: Obtain each type of tactile warning surfacing from single source with resources to provide materials and products of consistent quality in appearance and physical properties.

2.2 DETECTABLE WARNING TILES

A. Cast-in-Place Detectable Warning Tiles: Accessible truncated-dome detectable warning tiles with replaceable surface configured for setting flush in new concrete walkway surfaces, with slip-resistant surface treatment on domes and field of tile.

1. Material: Cast-fiber-reinforced polymer concrete tile.
2. Color: Dark Gray.
3. Shapes and Sizes:

    a. Rectangular panel, 24 inches by manufacturer’s standard lengths.

4. Dome Spacing and Configuration: Manufacturer's standard compliant spacing, in manufacturer's standard pattern.
5. Mounting:

    a. Permanently embedded detectable warning tile wet-set into freshly poured concrete.
    b. Replaceable detectable warning tile wet-set into freshly poured concrete and surface-fastened to permanently embedded anchors.

2.3 ACCESSORIES

A. Fasteners and Anchors: Manufacturer's standard as required for secure anchorage of tactile warning surfaces, noncorrosive and compatible with each material joined, and complying with the following:

1. Furnish Type 304 stainless-steel fasteners for exterior use.
2. Fastener Heads: For nonstructural connections, use flathead or oval countersunk screws and bolts with tamper-resistant heads, colored to match tile.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that pavement is in suitable condition to begin installation according to manufacturer's written instructions. Verify that installation of tactile warning surfacing will comply with accessibility requirements upon completion.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF TACTILE WARNING SURFACING

A. General: Prepare substrate and install tactile warning surfacing according to manufacturer's written instructions unless otherwise indicated.

B. Place tactile warning surfacing units in dimensions and orientation indicated. Comply with location requirements of AASHTO MP 12.

3.3 INSTALLATION OF DETECTABLE WARNING TILES

A. Removable Cast-in-Place Detectable Warning Tiles:

1. Concrete Paving Installation: Comply with installation requirements in Section 321313 "Concrete Paving." Mix, place, and finish concrete to conditions complying with detectable warning tile manufacturer's written requirements for satisfactory embedment of removable tile.
2. Set each detectable warning tile accurately and firmly in place with embedding anchors and fasteners attached, and firmly seat tile back in wet concrete by tamping or vibrating. If necessary, temporarily apply weight to tiles to ensure full contact with concrete.
3. Set surface of tile flush with surrounding concrete and adjacent tiles, with variations between tiles and between concrete and tiles not exceeding plus or minus 1/8 inch (3 mm) from flush.
4. Protect exposed surfaces of installed tiles from contact with wet concrete. Complete finishing of concrete paving surrounding tiles. Remove concrete from tile surfaces.
5. Clean tiles using methods recommended in writing by manufacturer.

3.4 CLEANING AND PROTECTION

A. Remove and replace tactile warning surfacing that is broken or damaged or does not comply with requirements in this Section. Remove in complete sections from joint to joint unless otherwise approved by Architect. Replace using tactile warning surfacing installation methods acceptable to Architect.

B. Protect tactile warning surfacing from damage and maintain free of stains, discoloration, dirt, and other foreign material.

3.5 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project's Waste Management Plan.

END OF SECTION 321726

SECTION 32 90 00 - LANDSCAPE WORK

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification sections apply to work specified in this section.

1.2 DESCRIPTION OF WORK

A. Subgrade elevations: Excavation, filling and grading required to establish elevations are not specified in this section.

B. Section Includes:
1. Planting soil
2. Seeding
3. Hydroseeding
4. Turf renovation
5. Planting of shrubs and other plants

1.3 REFERENCE STANDARDS

A. ANSI/AHIA Z60.1 - American National Standard for Nursery Stock.

B. ASTM C602 - Standard Specification for Agricultural Liming Materials.

1.4 QUALITY ASSURANCE

A. Landscape and seeding work are to be performed by a contracting firm or firms specializing in landscape and seeding work. Contractor must submit proof to the Engineer that they meet the following experience requirements:
1. Successfully completed a contract of similar work in an amount of not less than fifty percent of the amount of the proposed contract within the last 5 years.
2. Seventy-five percent of all the Contractor’s work in the last 3 years must have consisted of contracts in which a majority percentage of the contract sum was for the installation of plant material. List must include Owner’s name, project site, and contract amount.
3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
4. Pesticide Applicator: State licensed, commercial.

B. Soil Testing Agency Qualifications: An independent, state-operated, or university-operated laboratory; experienced in soil science, soil testing, and plant nutrition; with the experience and capability to conduct the testing indicated; and that specializes in types of tests to be performed.
1. Multiple Laboratories: At Contractor's option, work may be divided among qualified testing laboratories specializing in physical testing, chemical testing, and fertility testing.

C. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI/AHIA Z60.1.

D. Measurements: Measure according to ANSI/AHIA Z60.1. Do not prune to obtain required sizes.
   1. Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock. Measure main body of shrub for height and spread; do not measure branches or roots tip to tip.

E. Plant Material Observation: Engineer may observe plant material either at place of growth or at site before planting for compliance with requirements for genus, species, variety, cultivar, size, and quality. Engineer may also observe shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work. Remove rejected shrubs immediately from Project site.

1.5 SUBMITTALS

A. Qualification Data: For Landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.

B. Product Data: For each type of product.

C. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture, stating the botanical and common name, percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.

D. Product Certificates: For fertilizers, from manufacturer.

E. Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.

F. Plant Materials: Include quantities, sizes, quality, and sources for plant materials.

G. Planting Schedule: Submit planting schedule showing scheduled dates for each type of planting in each area of site. Once accepted, revise dates only as accepted in writing by the Engineer, after documentation of reasons for delay.

H. Off-Site Topsoil: Before delivery of topsoil from off-site sources, furnish Engineer with written statement giving location of properties from which topsoil is to be obtained, names and addresses of owners, depth to be stripped, and crops grown during the past 2 years.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with state and Federal laws if applicable.

B. Bulk Materials:
   1. Do not dump or store bulk materials near structures, utilities, walkways and pavements,

or on existing turf areas or plants.

2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
3. Do not move or handle materials when they are wet or frozen.
4. Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates

C. Do not prune shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

D. Handle planting stock by root ball.

E. Wrap shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

F. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.
1. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
2. Do not remove container-grown stock from containers before time of planting.
3. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.

1.7 JOB CONDITIONS

A. Proceed with and complete landscape work as rapidly as portions of site become available, working within seasonal limitations for each kind of landscape work required.

B. Determine location of underground utilities and perform work in a manner which will avoid possible damage. Hand excavate, as required. Maintain grade stakes set by others until removal is approved by parties concerned.

C. When conditions detrimental to plant growth are encountered, such as rubble fill, adverse drainage conditions, or obstructions, notify Engineer before planting.

D. Plant or install materials during normal planting seasons for each type of landscape work required. Correlate planting with specified maintenance periods to provide maintenance from date of substantial completion.

E. Plant and shrubs after final grades are established and prior to planting of lawns, unless otherwise acceptable to Engineer. If planting of shrubs occurs after lawn work, protect lawn areas and promptly repair damage to lawns resulting from planting operations.

F. Do not damage previously installed shrubs.

G. Observe precautionary measures to protect existing paved areas against damage during the planting operation.

H. Work Notification: Notify Engineer at least 48 hours in advance of the time Contractor intends to seed, and do not proceed with such work until permission has been granted.

I. Perform seeding work only after planting and other work affecting ground surface has been completed.

J. Seeding shall take place during normal planting seasons as established below. Actual weather conditions and seasonal variations will determine when seeding is warranted.
   1. Time of Seeding
      a. Seeding operations shall not occur at a time when the soil or backfill is frozen or the soil is saturated.
      b. Seeding seasons shall be April 1st to June 6th and August 20th to October 31st.
      c. When delays in operations carry the work beyond the seasons specified, or when conditions of high winds (winds that exceed 5 mph velocity), drought, excessive moisture or ice are such that satisfactory results are not likely to be obtained at any stage of the work, the work will stop. Seeding work shall be resumed only when the desired results are likely to be obtained or when the Authority and/or Engineer accepts a corrective measure and procedure.
      d. Dormant seeding may take place after November 15, but prior to continuous soil freeze. Success of dormant seeding determined at Engineer's discretion.
      e. Soil conditions shall prevail when the time of planting is in dispute.

K. Restrict traffic from lawn areas until grass is established. Erect signs and barriers as required.

1.8 SPECIAL PROJECT WARRANTY

A. Warranty lawns through specified maintenance period, and until final acceptance.

B. The Contractor at his expense through the use of fences, barricades, or other physical barriers shall protect newly seeded areas from foot traffic or vehicular trespass. Contractor shall monitor, repair, or replace barriers as necessary or as required by the Engineer.

C. The Contractor shall replace displaced mulch, remove eroded topsoil and adjust or replace disturbed seeded areas.

D. Plant Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by the Authority.
      b. Structural failures including plantings falling or blowing over.
   2. Warranty Periods: From date of final acceptance.
      a. Shrubs, Vines, and Ornamental Grasses: 12 months.
      b. Ground Covers, Biennials, Perennials, and Other Plants: 6 months.
   3. Include the following remedial actions as a minimum:
      a. Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
      b. Replace plants that are more than 33 percent dead or in an unhealthy condition at end of warranty period.
      c. A limit of one replacement of each plant is required except for losses or replacements due to failure to comply with requirements.

d. Provide extended warranty for period equal to original warranty period, for replaced plant material.

4. The time for replacing unsatisfactory plants shall be determined by the Engineer, or no later than the next succeeding planting season. Plants that are dead or that are in unhealthy or unsightly condition or that have lost their natural shape due to dead branches, excessive pruning or inadequate or improper maintenance, as determined by the Engineer, shall be removed from the site and replaced with plants as originally specified, at no cost to the the Authority. Plant replacement shall take place as is reasonably possible after their unsatisfactory condition is evident.

1.9 SOIL TESTING REQUIREMENTS

A. General: Perform tests on soil samples according to requirements in this article.

B. Physical Testing:
1. Soil Texture: Soil-particle, size-distribution analysis by one of the following methods according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods":
a. Sieving Method: Report sand-gradation percentages for very coarse, coarse, medium, fine, and very fine sand; and fragment-gradation (gravel) percentages for fine, medium, and coarse fragments; according to USDA sand and fragment sizes.
b. Hydrometer Method: Report percentages of sand, silt, and clay.

C. Fertility Testing: Soil-fertility analysis according to standard laboratory protocol of SSSA NAPT NEC-67, including the following:
1. Percentage of organic matter.
2. Soil reaction (acidity/alkalinity pH value).
3. Nitrogen ppm.
4. Phosphorous ppm.
5. Potassium ppm.
6. Soluble-salts ppm.

D. Recommendations: Based on the test results, state recommendations for soil treatments and soil amendments to be incorporated to produce satisfactory planting soil suitable for healthy, viable plants indicated. Include, at a minimum, recommendations for nitrogen, phosphorous, and potassium fertilization, and for micronutrients.
1. Fertilizer Rates: State recommendations in weight per 1000 sq. ft. for 4 inch depth of soil.
2. Soil Reaction: State the recommended liming rates for raising pH or sulfur for lowering pH according to the buffered acidity or buffered alkalinity in weight per 1000 sq. ft. for 4 inch depth of soil.

PART 2 PRODUCTS

2.1 TOPSOIL

A. Existing or Imported Topsoil: Shall be fertile, friable soil containing less than 10 percent total volume of the combination of subsoil, refuse, roots larger than 1 inch diameter, heavy, sticky or stiff clay, stones larger than 2 inches in any dimension. Topsoil shall be suitable for the germination of seeds and the support of vegetative growth. Imported Topsoil shall not contain

noxious weed seeds in quantities that cause noticeable weed infestations in the final planting beds.

1. Soil Texture: USDA loam, sandy clay loam or sandy loam with clay content between 15 and 25 percent and a combined clay/silt content no greater than 55 percent.
2. pH shall be between 5.5 and 7.0
3. Percent organic matter shall be between 2 and 5 percent%
4. Soluble salt level less than 2 mmho/cm
5. Soil chemistry suitable for growing the plants specified.

B. Unacceptable Properties: Topsoil shall not contain the following:
1. Unacceptable Materials: Concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials that are harmful to plant growth.
2. Large Materials: Stones, roots, clay lumps, and pockets of coarse sand exceeding 2 inches in any dimension.

C. Imported topsoil shall be harvested from fields or development sites. The organic content and particle size distribution shall be the result of natural soil formation. Manufactured soils where coarse sand, organic material or chemicals have been added to meet the requirements of Topsoil shall not be acceptable.

2.2 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
1. Class: T, with a minimum of 99 percent passing through a No. 8 sieve and a minimum of 75 percent passing through a No. 60 sieve.
2. Form: Provide lime in form of ground dolomitic limestone.

B. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent elemental sulfur, with a minimum of 99 percent passing through a No. 6 sieve and a maximum of 10 percent passing through a No. 40 sieve.

2.3 SEED

A. Grass Seed: Fresh, clean, dry, new-crop seed complying with AOSA's "Rules for Testing Seeds" for purity and germination tolerances.

B. Seed species:
1. For lawn areas (Seeding rate 5 lbs. per 1,000 sq. ft.):
a. 34% Blend of 3 perennial ryegrass species
b. 33% Creeping Red Fescue species
c. 33% Kentucky Bluegrass species

2.4 FERTILIZERS

A. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

1. Composition: 1 lb per 1,000 sq. ft. of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.

2.5 MULCHES

A. Straw Mulch: Provide air-dry, clean, mildew- and seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.

B. Fiber Mulch: Biodegradable, dyed-wood, cellulose-fiber mulch; nontoxic and free of plant-growth or germination inhibitors; with a maximum moisture content of 15 percent and a pH range of 4.5 to 6.5.

C. Nonasphaltic Tackifier: Colloidal tackifier recommended by fiber-mulch manufacturer for slurry application; nontoxic and free of plant-growth or germination inhibitors.

D. Organic Mulch for Shrubs: Free from deleterious materials and suitable as a top dressing of shrubs, consisting of the following:
1. Type: Double hammered seasoned hardwood mulch as commercially available

2.6 PESTICIDES

A. General: Pesticide, registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.7 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List, Plant Schedule, or Plant Legend indicated on Drawings and complying with ANSI/AHIA Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

B. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.

C. Provide plants of sizes, grades, and ball or container sizes complying with ANSI/AHIA Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Engineer, with a proportionate increase in size of roots or balls.

D. Root-Ball Depth: Furnish shrubs with root balls measured from top of root ball, which begins at root flare according to ANSI/AHIA Z60.1. Root flare shall be visible before planting.

E. Labeling: Label each plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant.

2.8 MISCELLANEOUS PRODUCTS

A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas to be planted for compliance with requirements and other conditions affecting installation and performance of the Work.
   1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.
   2. Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.
   3. Uniformly moisten excessively dry soil that is not workable or which is dusty.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Engineer and replace with new planting soil.

3.2 PREPARATION

A. Protect structures; utilities; sidewalks; pavements; and other facilities, shrubs, and plantings from damage caused by planting operations.
   1. Protect adjacent and adjoining areas from hydroseeding and hydromulching overspray.
   2. Protect grade stakes set by others until directed to remove them.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 TURF AREA PREPARATION

A. General: Prepare planting area for soil placement and mix planting soil.

B. Subgrade Preparation: Scarify subgrade to a minimum depth of 4 inches. Remove stones larger than 3 inches in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off the Authority's property.

C. Spread topsoil to minimum depth of 4 inches to meet lines, grades and elevations shown, after natural settlement.

D. Soil Amendments: Apply lime or sulfur as recommended by mechanical rotary or drop type distributor, thoroughly and evenly incorporated with soil to a depth of 3 inches by dicing or other approved method.

E. Fertilizing (For Conventional Seeding Method Only)
   1. Apply fertilizers by mechanical rotary or drop type distributor, thoroughly and evenly incorporated with soil to a depth of 3 inches by dicing or other approved method. Fertilize areas inaccessible to power equipment with hand tools and incorporate into soil.

F. Fine grade lawn areas to smooth, even surface with loose, uniformly fine texture. Roll and rake and remove ridges and fill depressions, as required to meet finish grades. Limit fine grading to areas which can be planted immediately after grading.
   1. Where seeded area is adjacent to pavement such as walks, curbs, parking lots, etc., the topsoil shall be no more than 1/2 inch below pavement surface prior to the seeding operation.

G. The borders of the area of ground disturbed shall be merged by "feathering" topsoil into surrounding surface areas by compacting, raking or other means, to permit water run-off and to present a uniform slope and transition.

H. Clean and clear all obstructions from drainage structures, ditches, swales, as may be necessary to provide a clean, open, free running passageway for all surface water.

I. Moisten prepared area before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

J. Before planting, obtain Engineer's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.4 CONVENTIONAL SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph.
   1. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.
   2. Do not use wet seed or seed that is moldy or otherwise damaged.
   3. Do not seed against existing trees. Limit extent of seed to outside edge of planting saucer.

B. Sow seed at rate indicated.

C. Rake seed lightly into top 1/8 inch of soil, and water with fine spray.

D. Protect seeded areas with slopes not exceeding 1:6 by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons per acre to form a continuous blanket 1-1/2 inches in loose thickness over seeded areas. Spread by hand, blower, or other suitable equipment.
   1. Anchor straw mulch by crimping into soil with suitable mechanical equipment.

3.5 HYDROSEEDING

A. Hydroseeding: Mix specified seed, commercial fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application.
   1. Mix slurry with fiber-mulch manufacturer's recommended tackifier.
   2. Spray-apply slurry uniformly to all areas to be seeded in a one-step process. Apply slurry at a rate so that mulch component is deposited at not less than 1500-lb per acre dry weight, and seed component is deposited at not less than the specified seed-sowing rate.

3.6 TURF RENOVATION

A. Renovate turf damaged by Contractor's operations, such as storage of materials or equipment and movement of vehicles.
   1. Reestablish turf where settlement or washouts occur or where minor regrading is required.
   2. Install Topsoil as required.

B. Remove sod and vegetation from diseased or unsatisfactory turf areas; do not bury in soil.

C. Remove topsoil containing foreign materials, such as oil drippings, fuel spills, stones, gravel, and other construction materials resulting from Contractor's operations, and replace with new planting soil.

D. Mow, dethatch, core aerate, and rake existing turf.

E. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.

F. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of them off the Authority's property.

G. Till stripped, bare, and compacted areas thoroughly to a soil depth of 6 inches.

H. Apply soil amendments and initial fertilizer required for establishing new turf and mix thoroughly into top 4 inches of existing soil. Install new planting soil to fill low spots and meet finish grades.

I. Apply seed and protect with straw mulch or hydroseed as required for new turf.

J. Water and maintain newly planted areas and keep moist until new turf is satisfactory.

3.7 TURF MAINTENANCE

A. General: Maintain and establish turf by watering, fertilizing, weeding, mowing, trimming, replanting, and performing other operations as required to establish healthy, viable turf. Roll, regrade, and replant bare or eroded areas and re mulch to produce a uniformly smooth turf. Provide materials and installation the same as those used in the original installation.
   1. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace materials and turf damaged or lost in areas of subsidence.
   2. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch and anchor as required to prevent displacement.

3. Apply treatments as required to keep turf and soil free of pests and pathogens or disease. Use integrated pest management practices whenever possible to minimize the use of pesticides and reduce hazards.

B. Watering: Install and maintain temporary piping, hoses, and turf-watering equipment to convey water from sources and to keep turf uniformly moist to a depth of 4 inches.
1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
2. Water turf with fine spray at a minimum rate of 1 inch per week unless rainfall precipitation is adequate.

C. Mow turf as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than one-third of grass height. Remove no more than one-third of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain grass height at 2 inches.

3.8 SATISFACTORY TURF

A. Turf installations shall meet the following criteria as determined by Engineer:
1. Satisfactory Seeded Turf: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 100 sq. ft.

B. Use specified materials to reestablish turf that does not comply with requirements, and continue maintenance until turf is satisfactory.

3.9 EXCAVATION FOR SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits.
1. Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.
2. Excavate approximately three times as wide as ball diameter for plant stock.
3. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.
4. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.
5. Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.
6. Maintain supervision of excavations during working hours.
7. Keep excavations covered or otherwise protected when unattended by Installer's personnel.

B. Backfill Soil: Topsoil unless otherwise indicated.

C. Obstructions: Notify Engineer if unexpected rock or obstructions detrimental to shrubs are

encountered in excavations.

D. Drainage: Notify Engineer if subsoil conditions evidence unexpected water seepage or retention in shrub planting pits.

3.10 SHRUB PLANTING

A. Inspection: At time of planting, verify that root flare is visible at top of root ball according to ANSI/AHIA Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most structural root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.

B. Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Balled and Burlapped Stock: Set each plant plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades.
   1. Backfill: Topsoil.
   2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
   3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
   4. Continue backfilling process. Water again after placing and tamping final layer of soil.

D. Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 1 inch above adjacent finish grades.
   1. Backfill: Topsoil.
   2. Carefully remove root ball from container without damaging root ball or plant.
   3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
   4. Continue backfilling process. Water again after placing and tamping final layer of soil.

E. Slopes: When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

3.11 SHRUB POST PLANTING PRUNING

A. Upon completion of planting, all shrubs shall be pruned and injuries repaired. The amount of pruning shall be limited to the minimum number of cuts necessary to remove dead or injured twigs and branches. Pruning shall be done in such a manner as not to change the natural habit or shape of the plant. All cuts shall be made at the branch collar without leaving a protruding stub. Pruning shall be in accordance with ANSI A300 Part 1 Maintenance Pruning objectives. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Do not apply pruning paint to wounds.

3.12 SHRUB PLANTING AREA MULCHING

A. Mulch backfilled surfaces of planting areas and other areas indicated.
   1. Mulch in Planting Areas: Apply 3-inch average thickness of organic mulch extending minimum 6 inches beyond drip edge of individual plants or over whole surface of planting area, and finish level with adjacent finish grades. Do not place mulch within 3 inches of trunks or stems.

3.13 SHRUB MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings.

B. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.14 CLEANUP AND PROTECTION

A. During landscape work keep pavements clean and work area in an orderly condition.

B. Protect landscape work and materials from damage due to landscape operations, operations by other contractors and trades and trespassers. Maintain protection during installation and maintenance periods. Treat, repair or replace damaged landscape work.

C. Remove construction equipment, excess materials and tools. Haul from site debris resulting from work of this section, and dispose of legally, and to the satisfaction of the Engineer.

3.15 INSPECTION AND ACCEPTANCE

A. When landscape work is completed, including maintenance, the Engineer will examine the work to determine compliance. Landscape work may be examined for acceptance in parts as determined by the Engineer, provided work offered for examination is complete, including maintenance.

B. Lawn areas will be considered acceptable provided all requirements, including maintenance, have been complied with, and a healthy, uniform, close stand of the specified grass is established free of weeds, undesirable grass species, disease, and insects.

C. Where landscape work does not comply with requirements, replace rejected work and continue specified maintenance until compliance with the specifications is achieved.

END OF SECTION 329000

SECTION 33 10 00 – WATER UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Extent of water distribution system work is shown on Drawings.

B. Water utilities work includes, but is not limited to, the following:

1. Piping
2. Valves
3. Hydrants
4. Testing
5. Disinfection

C. Comply with requirements of applicable Division 31 sections for excavation and backfilling required in connection with water distribution system.

D. Comply with requirements of applicable Division 03 sections for concrete work required in connection with water distribution system

E. Related Requirements:

1. City of Buffalo Division of Water Specifications: applicable for work associated with the City of Buffalo water mains and appurtenances.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: For piping and specialties including relation to other services in same area, drawn to scale. Show piping and specialty sizes and valves, meter and specialty locations, and elevations.

B. Field quality-control test reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For water valves and specialties to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Regulatory Requirements:

1. Comply with requirements of utility company supplying water. Include tapping of water mains and backflow prevention.
2. Comply with standards of authorities having jurisdiction for potable-water-service piping, including materials, installation, testing, and disinfection.
3. Comply with standards of authorities having jurisdiction for fire-suppression water-service piping, including materials, hose threads, installation, and testing.

B. Piping materials shall bear label, stamp, or other markings of specified testing agency.

C. Comply with ASTM F645 for selection, design, and installation of thermoplastic water piping.

D. Comply with FMG's "Approval Guide" or UL's "Fire Protection Equipment Directory" for fire-service-main products.

E. NFPA Compliance: Comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire-service-main piping for fire suppression.

1. Potable-water piping and components shall comply with NSF 14, NSF 61, and NSF 372.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Preparation for Transport: Prepare valves, including fire hydrants, according to the following:

1. Ensure that valves are dry and internally protected against rust and corrosion.
2. Protect valves against damage to threaded ends and flange faces.
3. Set valves in best position for handling. Set valves closed to prevent rattling.

B. During Storage: Use precautions for valves, including fire hydrants, according to the following:

1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

C. Handling: Use sling to handle valves and fire hydrants if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.

F. Protect flanges, fittings, and specialties from moisture and dirt.

G. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.8 PROJECT CONDITIONS

A. Interruption of Existing Water-Distribution Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water-distribution service according to requirements indicated:

1. Notify Architect no fewer than five days in advance of proposed interruption of service.
2. Do not proceed with interruption of water-distribution service without Architect's written permission.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Application" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

B. Potable-water piping and components shall comply with NSF 14, NSF 61, and NSF 372.

2.2 DUCTILE-IRON WATER PIPE FOR DIRECT BURY

A. Ductile-Iron water pipe in sizes three inches (3") to sixty-four inches (64") in diameter inclusive will be centrifugally cast conforming with the applicable requirements of the AWWA Standard for Ductile-Iron Pipe, Centrifugally Cast for Water, ANSI/AWWA C151/A21.51- (latest revision), as manufactured by the U.S. Pipe Co. or equal.

B. Ductile-Iron pipe less than 16” diameter shall be Class 52 unless otherwise specified on the plans.

C. Mechanical and push-on joints for ductile-iron pipe shall conform to the AWWA Standard for Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings. ANSI/AWWA C111/A21.11- (latest revision).

D. All ductile-iron pipe shall be double thickness cement lined in accordance with the requirements of the AWWA Standard for Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water. ANSI/AWWA C104/A21.4 - (latest revision).

E. Integral restrained joint ductile-iron pipe shall be: “TR-Flex” joint as manufactured by McWane, Inc. or US Pipe; “Flex-Ring” as manufactured by American Cast Iron Pipe Co.; or approved equal.

1. Flexible restrained joint pipe shall be a boltless, glandless restraining system utilizing patented ductile iron locking segments or flex ring with factory applied spigot retainer weldment.
2. Weldments must be factory applied. Field applied weldments will not be allowed.

    a. Field cut pipe and joints requiring restraint must utilize wedge action retainer glands or a flexible restrained closure.

3. Pipe that utilizes gaskets with embedded restraining gripper or friction segments will not be acceptable.

2.3 DUCTILE IRON FLANGED PIPE AND FITTINGS

A. Ductile Iron Pipe with Threaded Flanges:

1. Pipe shall be centrifugally cast ductile iron conforming to the requirements of AWWA C151 and C115 for material, dimensions, tolerance, tests, markings, and other requirements.
2. Where required, pipe barrels and flanges shall have a taper pipe thread (NPT) in accordance with ANSI B1.20.1, with pipe diameters adapted to ductile iron pipe standard outside diameters.
3. Flanged pipe shall be minimum Class 52 thickness and shall be furnished in standard laying lengths as specified or required.

B. Joints for Ductile Iron Flanged Pipe and Fittings:

1. Flanged joints shall conform to the requirements of AWWA C110 and drilling and facing of flanges shall be in accordance with ANSI B16.1 Class 125 flanges unless otherwise specified.
2. Flanged ductile iron pipe and fittings shall be furnished complete with all necessary joint accessories consisting of natural or synthetic rubber gaskets, $^{1}/_{8}$-inch thick, full face; and, nuts, bolts and washers, unless otherwise specified.
3. All nuts, bolts and washers for flanges and accessories shall conform to ANSI B18.2.1 and ANSI B18.2.2, respectively and shall be Type 304 stainless steel, high strength, low alloy steel or fluorocarbon coated as specified herein.

C. Flange Fillers, Blind Flanges and Reducing Companion Flanges:

1. Conform to the requirements of AWWA C115 for material, dimensions, tolerance, tests, markings and other requirements.
2. Drilling and facing of flanges shall be in accordance with ANSI B16.1, Class 125 flanges unless otherwise specified.
3. Flanged fillers, blind flanges and reducing companion flanges shall be furnished complete with all necessary joint accessories consisting of natural or synthetic rubber gaskets, $^{1}/_{8}$-inch thick, full face; and, nuts, bolts and washers, unless otherwise specified.
4. Threaded outlets or taps, (Mueller threads), shall be provided in blind flanges as specified or required.
5. All nuts, bolts and washers for flanges and accessories shall conform to ANSI B18.2.1 and ANSI B18.2.2, respectively and shall be Type 304 stainless steel, high strength, low alloy steel.

2.4 DUCTILE IRON FITTINGS

A. Ductile Iron Fittings

1. Ductile Iron fittings for three (3") inch to sixty-four (64") inch ductile iron and polyvinyl chloride pipes shall be Class 350 Ductile-Iron and conform to the AWWA Standard for Ductile-Iron Compact Fittings for Water Service, ANSI/AWWA C153/A21.53-(latest revision) as manufactured by Tyler Pipe Co. or equal.
2. All ductile-iron fittings shall be double thickness cement lined in accordance with the requirements of the AWWA Standard for Cement - Mortar Lining for Ductile-Iron Pipe and Fittings for Water, ANSI/AWWA C104/A21.4- (latest revision).
3. All ductile-iron fittings shall have mechanical joint ends and be furnished with sufficient quantities of accessories. All nuts and tee bolts for fittings shall be Flourocarbon coated, high strength, corrosion resistant, low alloy steel and shall conform to AWWA C-111/A21.11-(latest revision). Restrained joints utilizing mechanical joint wedge action retainer glands will be required.
4. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, "Protecto-Cap"; Trumbell Industries, Inc.; or equal.
5. Integral restrained joint ductile-iron fittings shall be: "TR-Flex" joint as manufactured by McWane, Inc. or US Pipe; "Flex-Ring" as manufactured by American Cast Iron Pipe Co.; or approved equal.

    a. Flexible restrained joint fittings shall be a boltless, glandless restraining system utilizing patented ductile iron locking segments or flex ring with factory applied spigot retainer weldment.
    b. Weldments must be factory applied. Field applied weldments will not be allowed.
    c. Fittings connected to field cut pipes without weldments must be mechanical joint utilizing wedge action retainer glands.

        1) If flexible restrained joint fittings are used, a number of mechanical joint fittings must also be provided and on-hand to allow for field adjustments.

    d. Fittings that utilize gaskets with embedded restraining gripper or friction segments will not be acceptable.

B. Thrust blocks and mechanical restraints will be provided where fittings are used for direction changes as shown on the plans and details, and wherever specified by the Engineer.

2.5 PVC PIPE AND FITTINGS

A. PVC, AWWA Pipe: AWWA C900, Class 150, with bell end with gasket, and with spigot end.

1. Comply with UL 1285 for fire-service mains if indicated.
2. PVC Fabricated Fittings: AWWA C900, Class 150, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.
3. PVC Molded Fittings: AWWA C907, Class 150, with bell-and-spigot or double-bell ends. Include elastomeric gasket in each bell.
4. Push-on-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Gaskets: AWWA C111, rubber.

5. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.

a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.6 PIPING SPECIALTIES

A. Transition Fittings: Manufactured fitting or coupling same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

B. Tubular-Sleeve Pipe Couplings:

1. Description: Metal, bolted, sleeve-type, reducing or transition coupling, with center sleeve, gaskets, end rings, and bolt fasteners and with ends of same sizes as piping to be joined.

a. Standard: AWWA C219.
b. Center-Sleeve Material: Manufacturer's standard.
c. Gasket Material: Natural or synthetic rubber.
d. Pressure Rating: 200 psig minimum.
e. Metal Component Finish: Corrosion-resistant coating or material.

2.7 GATE VALVES

A. Valves three inches (3”) to twelve inches (12”) shall be iron body with fusion bonded epoxy coating, and resilient seated conforming to the requirements of the AWWA Standard for Resilient-Seated Gate Valves, for Water Supply Service, ANSI/AWWA C509- (latest revision), as manufactured by the Mueller Co. or Kennedy Valve Mfg. Co. or approved equal.

B. All valves shall have non-rising stems, "0" ring seals (capable of being replaced under pressure), two inch (2") square operating nut, stainless steel bonnet bolts and nuts, open counter-clockwise (to the left), and have mechanical joint ends unless specified otherwise. Sufficient quantities of accessories shall be provided to install the valve in the pipeline.

C. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, “Protecto-Cap”; Trumbell Industries, Inc.; or equal.

D. Valves up to 12” diameter shall be designed to operate vertically in a horizontal pipeline.

E. Gate valves three inches (3”) to twelve inches (12”) shall be designed for a minimum design working pressure of 200 psig. Gate valves fourteen inches (14”) to forty-eight inches (48”) shall be designed for a minimum design working pressure of 150 psig.

F. All gate valves shall be designed for a minimum test pressure equal to the test pressure specified for the watermain.

2.8 GATE VALVE ACCESSORIES AND SPECIALTIES

A. Valve Boxes: Comply with AWWA M44 for cast-iron valve boxes. Include top section, adjustable extension of length required for depth of burial of valve, plug with lettering "WATER," and bottom section with base that fits over valve and with a barrel approximately 5 inches in diameter.

1. Operating Wrenches: Steel, tee-handle with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut.

2.9 CORPORATION VALVES AND CURB VALVES

A. Manufacturers:

B. Service-Saddle Assemblies: Comply with AWWA C800. Include saddle and valve compatible with tapping machine.

1. Service Saddle: Copper alloy with seal and AWWA C800, threaded outlet for corporation valve.
2. Corporation Valve: Bronze body and ground-key plug, with AWWA C800, threaded inlet and outlet matching service piping material.

C. Curb Valves: Comply with AWWA C800. Include bronze body, ground-key plug or ball, and wide tee head, with inlet and outlet matching service piping material.

2.10 FIRE HYDRANTS

A. Hydrants shall conform to the requirements of the AWWA Standard For Dry-Barrel Fire Hydrants, ANSI/AWWA C502-(latest revision) and as follows:

1. Type - "breakaway" with "0" ring seals
2. Valve opening – 5¼" diameter
3. Inlet - 6" mechanical joint
4. Nozzles: one 4½" pumper nozzle and two 2½" hose nozzles, all with National Standard Threads. Caps with chains will be required for all outlets.
5. Bury - designed to allow 4 feet of cover on the branch and allow 15 to 18 inches between the centerline of the lowest nozzle and the surface of the ground
6. Operating nut – 1 ½” pentagon
7. Direction of opening - left (counterclockwise)
8. Color – Yellow, (manufacturer applied)
9. Valve shall open against pressure and close with pressure
10. All working parts are to be in the bonnet of the hydrant above the nozzles, not in the waterway
11. Valve opening limit stops shall be in the shoe of the hydrant
12. All external hardware (bolts & nuts, etc.) - Stainless Steel required
13. Lower operating stem - Stainless Steel required
14. All hydrants to be furnished with no weeps
15. All hydrants shall be as manufactured by the Mueller Co. of the Centurian Pattern, including a bronze seat ring and weather shield/seal.

16. All new hydrants shall have touch-up paint applied in the field as necessary after installation with matching paint color by Rust-Oleum, Pennsbury “Hydrant-Hide”, or equal.

2.11 ANCHORAGES

A. General: Provide anchorages for tees, plugs, caps, bends, valves, couplings and pipe as shown on the plans and as follows:

1. Retainer glands shall be wedge action EBAA Iron Series 1100 for ductile iron pipe or EBAA Iron Series 2000 PV for PVC pipe or approved equal to fit mechanical joints.
2. Restraining harnesses shall be wedge action EBAA Iron Series 1700 Megalug for push joint ductile iron pipe or EBAA Iron Series 1600 for push joint PVC pipe or approved equal. Restraining harnesses for cast iron pipe joints shall be of the friction clamp type with threaded rods.
3. All anchorages shall have fusion bonded epoxy coating.
4. All bolts and nuts for buried joints shall be Fluorocarbon coated, high strength, corrosion resistant, low alloy steel, conforming to ANSI/AWWA C-111/A21.11- (latest revision).
5. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, “Protecto-Cap”; Trumbell Industries, Inc.; or equal.
6. All bolts and nuts for use inside chambers shall be Fluorocarbon coated, high strength, corrosion resistant, low alloy steel, conforming to ANSI/AWWA C-111/A21.11- (latest revision).
7. Thrust Blocks shall be 3000 psi concrete.

2.12 ANCHOR PIPE, COUPLINGS, TEES AND ELBOWS

A. All M.J. anchoring pipe, couplings, tees and elbows shall be as manufactured by Tyler Pipe Co. or equal. They shall be cement-lined in accordance with the requirements of the AWWA Standard for Cement - Mortar Lining for Ductile Iron Pipe and Fittings for Water, ANSI/AWWA C104/A21.4- (latest revision) and the thickness shall not be less than 1/8". All anchoring pipe, couplings, tees and elbows shall meet pressure requirements equivalent to that for pipe.

B. All nuts and bolts for joints shall be Fluorocarbon Coated, high strength, corrosion resistant, low alloy steel, and shall conform to AWWA C-111/A21.11 (latest revision).

C. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, “Protecto-Cap”; Trumbell Industries, Inc.; or equal.

2.13 COUPLINGS AND REPAIR CLAMPS

A. Couplings and clamps shall be as manufactured by Smith-Blair Inc., Ford Meter Box Co., Inc., Romac Industries, Inc., or approved equal.

B. Couplings and clamps shall be equipped with high strength, low alloy steel bolts and nuts having a fluorocarbon SC-1 coating.

C. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, “Protecto-Cap”; Trumbell Industries, Inc.; or equal.

D. Gaskets for couplings and joint clamps shall be molded rubber, Smith-Blair grade 30, Ford SBR compound, Romac SBR, or equal. Gaskets for repair clamps shall be molded rubber, grade 60, SBR compound, Nitrile (Buna N), or equal.

E. Sleeve type, Flexible Couplings shall be of the Smith-Blair type #411 (or #441 “Omni” where specified); Ford style FC1; Romac style 501; or equal. All couplings shall have fusion bonded epoxy coating finish.

F. Bell joint leak clamps shall be: Smith-Blair type #274; Ford style FBC; Romac style 516 or 416; or equal.

G. Transition couplings shall be: Smith-Blair type #413; Ford style FC2A; Romac style 501; or equal. All couplings shall have fusion bonded epoxy coating finish.

H. Repair clamps shall be full circle, 18-8 type 304 stainless steel, provided in minimum length of twelve inches (12"), unless otherwise noted.

1. Repair clamps for diameters up to twelve inches (12”) shall be single band as manufactured by: Smith-Blair type #261; Ford style FS1; Romac style SS1; or approved equal.
2. Repair clamps for sizes over twelve inches (12”) shall be with two or three sections as manufactured by: Smith-Blair type #263; Ford style FS2 or FS3; Romac style SS3; or approved equal.
3. All Repair Clamps shall be equipped with high strength, low alloy steel stud bolts and nuts having a fluorocarbon SC-1 coating.
4. Repair clamps with a separate keeper bar will not be accepted.
5. Cast iron or ductile iron fingers are not allowed except as noted or as approved by the Engineer.

2.14 HYMAX STYLE COUPLINGS

A. Hymax style couplings may be used only when approved by the Owner and/or Engineer.

B. Hymax style couplings for diameters up to twelve inches (12”) shall be as manufactured by: “Hymax Wide Range Coupling” or “Hymax Grip Wide Range Coupling”; Romac “Macro HP”; Smith-Blair #421, or approved equal. For diameters over twelve inches (12”): Krausz Industries, “Hymax Wide Range Coupling”; “Hymax Grip Wide Range Coupling”; or approved equal.

C. Center sleeve shall be fabricated of high strength carbon steel tubing with NFS-61 approved, fusion bonded epoxy coating on both interior and exterior.

D. Compression end rings to be either one bolt or two and fabricated of carbon steel.

E. Buried or submerged couplings shall be provided with Type 304 stainless steel bolts and nuts with anti-seize coating to prevent galling.

F. All field installed bolts for direct bury shall be capped with 6 ounce Zinc Anode cap nuts as manufactured by Maple Agencies, “Protecto-Cap”; Trumbell Industries, Inc.; or equal.

G. Gaskets shall be one piece, or two layered of which inner ring is removable to expand the range of the coupling. Gasket material shall be EPDM according to NSF61.

2.15 FLANGED COUPLING ADAPTERS

A. Flanged Coupling Adapters shall be as manufactured by: EBAA Iron, Series 2100 MegaFlange; Smith-Blair, Style 911 Flange-Lock; Ford style FFCA-XXX-K w/optional anchor studs; Krausz Industries, Hymax, Grip Flange Adapter; Romac, RFCA; or approved equal.

B. Coupling shall have ductile iron body and follower gland with bolt pattern conforming to AWWA C115 flanges.

C. Coupling body shall be painted with one coat of shop prime enamel and gasket ring shall have fusion bonded epoxy coating.

D. Gaskets and “O” rings shall be grade 30.

E. Bolts and nuts shall be either Type 304 stainless steel or high strength, low alloy steel having a fluorocarbon SC-1 coating.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Refer to Section 312000 "Earth Moving - Site" for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. General: Use pipe, fittings, and joining methods for piping systems according to the following applications.

B. Transition couplings and special fittings with pressure ratings at least equal to piping pressure rating may be used, unless otherwise indicated.

C. Do not use flanges or unions for underground piping.

D. Flanges, unions, grooved-end-pipe couplings, and special fittings may be used, instead of joints indicated, on aboveground piping and piping in vaults.

3.3 VALVE APPLICATIONS

A. General Application: Use mechanical-joint-end valves for NPS 3 and larger underground installation. Use corporation valves and curb valves with ends compatible with piping, for NPS 2 and smaller installation.

B. Drawings indicate valve types to be used.

3.4 PIPING INSTALLATION

A. Make connections NPS 2 and smaller with drilling machine according to the following:

1. Install service-saddle assemblies and corporation valves in size, quantity, and arrangement required by utility company standards.
2. Install service-saddle assemblies on water-service pipe to be tapped. Position outlets for corporation valves.
3. Use drilling machine compatible with service-saddle assemblies and corporation valves. Drill hole in main. Remove drilling machine and connect water-service piping.
4. Install corporation valves into service-saddle assemblies.
5. Install curb valve in water-service piping with head pointing up and with service box.

B. Install ductile-iron, water-service piping according to AWWA C600 and AWWA M41.

C. Install PVC, AWWA pipe according to ASTM F645 and AWWA M23.

D. Bury piping with depth of cover over top at least 60 inches.

E. Extend water-service piping and connect to water-supply source and building-water-piping systems at outside face of building wall in locations and pipe sizes indicated.

1. Terminate water-service piping at building wall until building-water-piping systems are installed. Terminate piping with caps, plugs, or flanges as required for piping material. Make connections to building-water-piping systems when those systems are installed.

F. Install underground piping with restrained joints at horizontal and vertical changes in direction. Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

3.5 ANCHORAGE INSTALLATION

A. Anchorage, General: Install water-distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following:

1. Concrete thrust blocks.
2. Locking mechanical joints.
3. Set-screw mechanical retainer glands.
4. Bolted flanged joints.
5. Pipe clamps and tie rods.

B. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches. Include anchorages for the following piping systems:

1. Gasketed-Joint, Ductile-Iron, Water-Service Piping: According to AWWA C600.
2. Gasketed-Joint, PVC Water-Service Piping: According to AWWA M23.

C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

3.6 VALVE INSTALLATION

A. AWWA Gate Valves: Comply with AWWA C600 and AWWA M44. Install each underground valve with stem pointing up and with valve box.

B. Corporation Valves and Curb Valves: Install each underground curb valve with head pointed up and with service box.

3.7 FIRE HYDRANT INSTALLATION

A. General: Install each fire hydrant with separate gate valve in supply pipe, anchor with restrained joints or thrust blocks, and support in upright position.

B. AWWA Fire Hydrants: Comply with AWWA M17.

C. UL/FMG Fire Hydrants: Comply with NFPA 24.

3.8 CONNECTIONS

A. Connect water-distribution piping to existing water main.

B. Connect water-distribution piping to interior domestic water and fire-suppression piping.

3.9 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

PART 4 - TESTING (As per ANSI/AWWA C600 latest revision for DIP; ANSI/AWWA C605 for PVC;)

4.1 TESTING AND DISINFECTION PROCEDURE

A. Prior to performing any work as described in this part, the Contractor shall submit to the Engineer for approval a flushing, testing and/or disinfection procedure. The procedure shall include when the work will be performed, source points for water, flush points for water, length and location of waterline to be included, and de-chlorination procedures.

4.2 PRELIMINARY FLUSHING

A. Prior to the pressure and leakage tests, and line valve tests, each potable water system shall be flushed until three (3) pipe volumes have passed through the new waterline and the water runs visually clear. Each valved system of the newly installed piping system shall be flushed separately with potable water from the public supply.

B. Flushing must have sufficient flowrate to achieve a fluid velocity of 3.0 feet per second inside the waterline. A 2-inch minimum diameter tap is required for proper flushing of all watermains having a diameter of 8-inches or less. Multiple or larger taps/outlets may be required to achieve minimum 3.0 ft./sec. flushing velocities as referenced in AWWA C651 and as determined by the Engineer.

C. When filling of the new line for flushing is achieved by accepting water from an existing water line, the Contractor shall, as a minimum, maintain an open outlet on the new work at all times that the connection between the existing water line and the new work is open. After initial filling/flushing, the Contractor shall, as a minimum, furnish and install a reduced pressure zone (RPZ) backflow preventer at the source of the supply to protect against the backflow of water from the new line into the existing line. When water is obtained from existing Town waterlines for these purposes, the work shall be coordinated with and approved by the water department having jurisdiction, and the water shall be metered.

4.3 PERFORM HYDROSTATIC TESTING OF COMPLETED CONDUIT LINES IN ACCORDANCE WITH THE FOLLOWING:

A. Test No. 1 - Pressure Test:

1. Assumptions:

   a. AWWA requirement of hydrostatic test pressure to be based on the elevation of the lowest point in the line or section under test corrected to the elevation of the test gauge.
   b. Minimum test pressure required: All pipe shall be tested by pressure 50% in excess of the normal working pressures, but in no event at less than 170 psi.

2. The maximum length of pipeline to be tested at any one time shall not exceed 2,000 lineal feet or valve to valve, whichever is less.

B. Test No. 2 - Leakage Test:

1. The hydrostatic pressure shall be the same as determined for Test No. 1 Pressure Test.
2. The leakage test may be conducted concurrently with the pressure test.
3. The maximum length of pipeline to be tested at any one time shall not exceed 2,000 lineal feet or valve to valve, whichever is less.
4. The leakage for pressure pipelines shall not exceed 75% of the AWWA allowable rates in gallons per hour per 1,000 feet of pipe at the test pressure specified above per the following table:

Pipe Diameter	Pipe Material	AWWA Allowable Leakage (GPH)
4"	PVC, DI	0.35
6"	PVC, DI	0.53
8"	PVC, DI	0.70
10"	PVC, DI	0.88
12"	PVC, DI	1.06
16"	DI, PCCP	1.57

20"	DI, PCCP	1.96
24"	DI, PCCP	2.35

4.4 DURATION

A. The duration of the pressure test (Test No. 1) shall be a minimum of two (2) hours for all pipe.

B. The duration of the leakage test (Test No. 2) shall be a minimum of two (2) hours for all pipe.

C. Pressure should not fluctuate by more than 5 psi during testing.

4.5 PROCEDURE

A. The pipe shall be slowly filled with water and the specified test pressure, measured at the point of lowest elevation, shall be applied by means of a pump connected to the pipe in a satisfactory manner. The pump, pipe connections, all necessary apparatus, taps into the pipe, gauges, and measuring devices, will be furnished by the Contractor. All work shall be accomplished by the Contractor.

B. When initial filling/flushing of the new line is achieved by accepting water from an existing water line, the Contractor shall, as a minimum, maintain an open outlet on the new work at all times that the connection between the existing water line and the new work is open. After initial filling/flushing, the Contractor shall, as a minimum, furnish and install a reduced pressure zone (RPZ) backflow preventer at the source of supply to protect against the backflow of water from the new line into the existing line. When water is obtained from existing Town waterlines for these purposes, the work shall be coordinated with and approved by the water department having jurisdiction, and the water shall be metered.

C. Testing shall be done as soon as the main line is installed and prior to disinfection.

4.6 EXPELLING AIR BEFORE TESTING

A. Before applying the specified test pressure, all air shall be expelled from the pipe. To accomplish this, taps shall be made, if necessary, at various locations and elevations in the test section including the points of highest elevation in the test section. After satisfactory test results, these taps shall be tightly closed and copper tube removed.

4.7 EXAMINATION UNDER PRESSURE (TEST NO. 1)

A. All exposed pipes, joints and fittings which are exposed when the test is conducted, shall be carefully examined for visible leakage. Those portions of the pipeline covered by backfill shall be walked to observe leakage appearing on the ground surface. Any leaks discovered in the joints shall be corrected until tight. Any cracked or defective pipe, fittings, etc., discovered in consequence of this pressure test shall be removed and replaced by the Contractor with new material as previously specified and the test repeated until satisfactory to the Engineer.

B. If the pressure drop is greater than 5 psi in 2 hours, or if the Engineer believes the line is suspect, the Contractor shall explore for the cause of the excessive leakage and after repairs have been made, the line shall be retested. This procedure shall be repeated until the pressure loss is less than the maximum allowable and the Engineer is satisfied.

4.8 PERMISSIBLE LEAKAGE (TEST NO. 2)

A. Suitable means (acceptable to the Engineer) shall be provided by the Contractor for determining the quantity of water loss by leakage under the specified test pressure. No pipe installation will be acceptable until, or unless, this leakage is less than that specified in this Section, at the test pressure specified.

B. Should any test of pipe laid disclose leakage greater than that specified in this section, the Contractor shall, at his own expense, locate and repair the defective joints or pipe until the leakage is within the specified allowable.

4.9 LEAKAGE DEFINED

A. Leakage is defined as the quantity of water to be supplied into the newly laid pipe necessary to maintain the specified leakage test pressure after the pipe has been filled with water and the air expelled.

B. At the end of each test, the pressure shall be increased to the starting pressure so leakage test data may be acquired.

4.10 WATER FOR TESTING

A. Water for performing all tests shall be furnished and disposed of by the Contractor, at his expense. If the water for filling and testing is obtained from an existing Town waterline a meter shall be installed to measure the quantity of water used for these purposes. , The cost of water used shall be borne by the Contractor. No water shall be obtained from an existing water line unless the Contractor first obtains the consent of the Owner or agency having jurisdiction over the existing main. Existing conditions may restrict the amount and rate of water that can be obtained from the existing line and the Contractor shall comply with the directions of the Owner or agency of jurisdiction.

B. When filling of the new line for testing is achieved by accepting water from an existing water line, the Contractor shall, as a minimum, furnish and install a reduced pressure zone (RPZ) backflow preventer at the source of the supply to protect against the backflow of water from the new line into the existing line. When water is obtained from existing Town waterlines for these purposes, the work shall be coordinated with and approved by the water department having jurisdiction, and the water shall be metered.

PART 5 - DISINFECTION (AS PER ANSI/AWWA C651-(LATEST REVISION))

5.1 ADJUST AND CLEAN

A. Disinfection of Potable Water Systems: All piping connecting to, and forming a part of, a potable water system shall be disinfected in a manner acceptable to the New York State Department of Health. The method described as follows, or other method acceptable to the Health Department having jurisdiction, shall be used. Water for disinfection and flushing shall be furnished and disposed of by the Contractor.

5.2 CHLORINATION

A. Disinfect the piping system with chlorine applied by introduction of a hypochlorite solution derived from Sodium Hypochlorite (NaOCl) solution, conforming to ANSI/AWWA B300. The use of Liquefied Elemental Chlorine Gas (Cl_2) and/or Calcium Hypochlorite in any form shall not be allowed.
   1. Sodium Hypochlorite shall be provided in liquid form containing approximately 5% to 15% available (free) chlorine.

B. Solutions shall be prepared in a plastic or rust-free steel barrel.

C. The clear supernatant shall be applied to the main through a rubber hose by a suitable pump feeder. The point of application of the chlorinating agent shall be at the beginning of the piping system or any valved sections thereof, through a corporation inserted in the top of the newly installed pipe. Water from the existing distribution system shall be controlled so as to flow slowly into the newly installed piping system during the application of the chlorine. The rate of chlorine mixture flow shall be in such proportion to the water entering the newly installed pipe that the resulting free chlorine residual shall be between 50 and 100 ppm (*mg/l*). Concentrations over 100 ppm (*mg/l*) shall not be allowed to enter the piping system. Valves shall be manipulated so that the strong chlorine solution in the pipe being treated will not flow back into the line supplying the water.

D. The chlorinated water shall be retained in the main for at least 24 hours, during which time all valves and hydrants in the section treated shall be operated in order to disinfect the appurtenances. At the end of this 24-hour period, the treated water shall contain no less than 25-ppm chlorine throughout the length of the main.

E. When making repairs, connections of the approved water main to the existing system, or when specified, the structures and portions of pipe lines not able to be disinfected by conventional methods, shall be chlorinated by a concentrated chlorine solution containing between 200 ppm (*mg/l*) and 300 ppm (*mg/l*) of free chlorine. The solution shall be applied with a brush or sprayed on the entire inner surface of the empty pipes and structures. The surfaces disinfected shall remain in contact with the strong chlorine solution for at least 30 minutes.

F. The Contractor must use an approved test method to determine chlorine levels. Test strips will be allowed for testing chlorine levels if the kit is new, in the original bottle, and has a color coded scale on the side with legible concentrations defined. Sending samples to an approved laboratory is also acceptable.

5.3 FINAL FLUSHING (As per ANSI/AWWA C655-(latest revision)

A. After the applicable retention period, the heavily chlorinated water shall be flushed from the main until the chlorine concentrated in the water leaving the main is no higher than that generally prevailing in the system, or less than 1 ppm. Chlorine residual determination shall be made at

each bacteriological water sampling location to ascertain that the heavily chlorinated water has been removed from the pipeline.

B. Superchlorinated water shall be emptied into a tank truck, or similar containment device, and neutralized using a reducing agent (such as Sodium Thiosulfate) prior to being discharged in a manner that will not adversely affect flora and fauna, and shall conform to applicable state regulations for waste discharge as found in ANSI/AWWA C655-(latest revision) and NYSCRR Title 6, Chapter X, parts 700 - 705 (Water Quality Regulations).

C. Discharge of water into a storm or sanitary sewer system will require prior written approval from the municipality or owner/operator of the utility.

D. Water from flushing procedures shall not be discharged into a public roadway and shall not cause damage to any public or private property.

PART 6 - BACTERIOLOGICAL TEST (AS PER ANSI/AWWA C651-(LATEST REVISION), SECTION 5)

6.1 PROCEDURE

A. Sampling:

1. After completion of final flushing, before the new water main is connected to the distribution system, and in the presence of the Engineer, two (2) sets of bacteriological water samples shall be collected from an acceptable outlet(s) of the treated piping system (one immediately after final flushing and a second one after a minimum of 16 hours).
2. Other than the amount of water required to collect samples at each location, all water must be retained in the new main after final flushing until after the final set of bacteriological samples is collected. No additional flushing will be allowed during the sampling procedure.
3. If additional flushing is required to reduce chlorine residual, bacteriological sampling must cease and not resume until flushing operations have stopped and chlorine residual has reached acceptable levels.

B. Testing and Analysis:

1. All water samples shall be tested to show the presence of a free chlorine residual and the absence of coliform organisms in accordance with the latest Health Department requirements. If, at this time, the samples show unsatisfactory results, the chlorine treatment shall be repeated until all samples show safe results.
2. Bacteriological testing and analysis must be performed at a laboratory approved by the Health Department and the Owner and shall be paid for by the Contractor. Samples must be picked up by laboratory personnel and delivered to the laboratory. The certified bacteriological test results must be delivered to the Owner and/or Engineer immediately upon completion.
3. Bacteriological test results shall expire 30 calendar days after the samples are taken. After 30 calendar days, if the new main has not been placed into service, the Contractor will be required to repeat the process, taking two sets of samples and submitting the results to the Engineer for review.
4. Per AWWA C651 standards, the maximum length of new pipe that can be installed without bacteriological sampling is 20 lineal feet unless otherwise approved by the Owner, Engineer, and the Health Department having jurisdiction.

C. Sampling Locations:

1. The number of bacteriological water samples taken along the full length of pipeline shall be as determined by the Engineer and shall be acceptable to the Health Department having jurisdiction.
2. As a minimum, bacteriological water samples shall be taken as follows:
   a. At a maximum of every 1,000 feet along the new water main.
   b. Within 10 feet of each end of each section of water main
   c. Fire hydrants and hoses are not considered acceptable sampling ports.
3. The Contractor shall, at his expense, provide all necessary taps (wet or dry), outlets, fittings, piping, apparatus, labor, materials, equipment, water, etc. required.

END OF SECTION 331000

SECTION 33 30 00- SANITARY SEWER SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. PVC pipe and fittings.
2. Non pressure-type transition couplings.
3. Cleanouts.
4. Manholes.
5. Concrete.

B. Related Requirements:

1. City of Buffalo Department of Public Works Division of Engineering: Standards and Specifications for Construction and Materials, dated January 1, 1988 and all sections and articles reference thereto and as amended.
2. Buffalo Sewer Authority standards and inspection requirements.

1.3 ACTION SUBMITTALS

A. Product Data: For the following:

1. Pipe and fittings.
2. Non-pressure and pressure couplings
3. Expansion joints and deflection fittings.
4. Cleanouts.

B. Shop Drawings: For manholes. Include plans, elevations, sections, details, and frames and covers.

1.4 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of pipe and fitting.

B. Field quality-control reports.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Do not store plastic manholes, pipe, and fittings in direct sunlight.

B. Protect pipe, pipe fittings, and seals from dirt and damage.

C. Handle manholes according to manufacturer's written rigging instructions.

1.6 FIELD CONDITIONS

A. Interruption of Existing Sanitary Sewerage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:

1. Notify Architect no fewer than five days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without Architect's written permission.

PART 2 - PRODUCTS

2.1 PVC PIPE AND FITTINGS

A. PVC Type PSM Sewer Piping:

1. Pipe: ASTM D3034, SDR 35, PVC Type PSM sewer pipe with bell-and-spigot ends for gasketed joints.
2. Fittings: ASTM D3034, PVC with bell ends.
3. Gaskets: ASTM F477, elastomeric seals.

2.2 NONPRESSURE-TYPE TRANSITION COUPLINGS

A. Comply with ASTM C1173, elastomeric, sleeve-type, reducing or transition coupling; for joining underground non pressure piping. Include ends of same sizes as piping to be joined and include corrosion-resistant-metal tension band and tightening mechanism on each end.

B. Sleeve Materials:

1. For Plastic Pipes: ASTM F477, elastomeric seal or ASTM D5926, PVC.
2. For Dissimilar Pipes: ASTM D5926, PVC or other material compatible with pipe materials being joined.

C. Unshielded, Flexible Couplings:

1. Description: Elastomeric sleeve with corrosion-resistant-metal tension band and tightening mechanism on each end.

D. Shielded, Flexible Couplings:

1. Description: ASTM C1460, elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.

2.3 CLEANOUTS

A. Cast-Iron Cleanouts:

1. Description: ASME A112.36.2M, round, gray-iron housing with clamping device and round, secured, scoriated, gray-iron cover. Include gray-iron ferrule with inside calk or spigot connection and countersunk, tapered-thread, brass closure plug.
2. Top-Loading Classification(s): Heavy Duty.
3. Sewer Pipe Fitting and Riser to Cleanout: ASTM A74, Service class, cast-iron soil pipe and fittings.

B. PVC Cleanouts:

1. Description: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

2.4 MANHOLES

A. Standard Precast Concrete Manholes:

1. Description: ASTM C478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
4. Base Section: 6-inch minimum thickness for floor slab and 6-inch minimum thickness for walls and base riser section; with separate base slab or base section with integral floor.
5. Riser Sections: 6-inch minimum thickness, of length to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated; with top of cone of size that matches grade rings.
7. Joint Sealant: ASTM C990, bitumen or butyl rubber.
8. Resilient Pipe Connectors: ASTM C923, cast or fitted into manhole walls, for each pipe connection.
9. Steps: Individual FRP steps or FRP ladder; wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
10. Adjusting Rings: Interlocking HDPE rings, with level or sloped edge in thickness and diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.
11. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, with diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope.

B. Designed Precast Concrete Manholes:

1. Description: ASTM C913; designed according to ASTM C890 for A-16 (ASSHTO HS20-44 in AASHTO HL), heavy-traffic, structural loading; of depth, shape, and dimensions indicated, with provision for sealant joints.
2. Ballast: Increase thickness of one or more precast concrete sections or add concrete to manhole as required to prevent flotation.
3. Joint Sealant: ASTM C990, bitumen or butyl rubber.
4. Resilient Pipe Connectors: ASTM C923, cast or fitted into manhole walls, for each pipe connection.
5. Steps: Individual FRP steps or FRP ladder; wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
6. Adjusting Rings: Interlocking HDPE rings, with level or sloped edge in thickness and diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.
7. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, with diameter matching manhole frame and cover, and with height as required to adjust manhole frame and cover to indicated elevation and slope.

C. Manhole Frames and Covers:

1. Description: Ferrous; 24-inch ID by 7- to 9-inch riser, with 4-inch-minimum-width flange and 26-inch-diameter cover. Include indented top design with lettering cast into cover, using wording equivalent to "SANITARY SEWER."
2. Material: ASTM A536, Grade 60-40-18 ductile iron unless otherwise indicated.

2.5 CONCRETE

A. General: Cast-in-place concrete complying with ACI 318, ACI 350, and the following:

1. Cement: ASTM C150, Type II.
2. Fine Aggregate: ASTM C33, sand.
3. Coarse Aggregate: ASTM C33, crushed gravel.
4. Water: Potable.

B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A1064, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A615, Grade 60 deformed steel.

C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.

1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.

    a. Invert Slope: 2 percent through manhole.

2. Benches: Concrete, sloped to drain into channel.

    a. Slope: 4 percent.

D. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A1064, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A615, Grade 60 deformed steel.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Section 312000 "Earth Moving - Site."

3.2 PIPING INSTALLATION

A. General Locations and Arrangements: Drawing plans and details to indicate general location and arrangement of underground sanitary sewer piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.

B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.

C. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.

D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.

E. Install gravity-flow, non pressure, drainage piping according to the following:

1. Install piping pitched down in direction of flow, at minimum slope of **1** percent unless otherwise indicated.
2. Install piping NPS 6 and larger with restrained joints at tee fittings and at changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place-concrete supports or anchors.
3. Install piping with 36-inch minimum cover.

4. Install PVC Type PSM sewer piping according to ASTM D2321 and ASTM F1668.

F. Clear interior of piping and manholes of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed. Place plug in end of incomplete piping at end of day and when work stops.

3.3 PIPE JOINT CONSTRUCTION

A. Join gravity-flow, non pressure, drainage piping according to the following:

1. Join PVC Type PSM sewer piping according to ASTM D2321 and ASTM D3034 for elastomeric-seal joints or ASTM D3034 for elastomeric-gasket joints.
2. Join dissimilar pipe materials with non pressure-type, flexible or rigid couplings.

B. Pipe couplings, expansion joints, and deflection fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

1. Use non pressure flexible couplings where required to join gravity-flow, non pressure sewer piping unless otherwise indicated.

a. Unshielded flexible or rigid couplings for pipes of same or slightly different OD.
b. Unshielded, increaser/reducer-pattern, flexible or rigid couplings for pipes with different OD.

3.4 MANHOLE INSTALLATION

A. General: Install manholes complete with appurtenances and accessories indicated.

B. Install precast concrete manhole sections with sealants according to ASTM C891.

C. Form continuous concrete channels and benches between inlets and outlet.

D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 3 inches above finished surface elsewhere unless otherwise indicated.

3.5 CONCRETE PLACEMENT

A. Place cast-in-place concrete according to ACI 318.

3.6 CLEANOUT INSTALLATION

A. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade. Install piping so cleanouts open in direction of flow in sewer pipe.

3.7 CONNECTIONS

A. Connect non pressure, gravity-flow drainage piping to building's sanitary building drains specified in Section 221316 "Sanitary Waste and Vent Piping."

B. Make connections to existing piping and underground manholes.

1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch overlap with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
2. Make branch connections from side into existing piping, NPS 4 to NPS 20. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
3. Protect existing piping and manholes to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

3.8 IDENTIFICATION

A. Comply with requirements in Section 312000 "Earth Moving - Site" for underground utility identification devices. Arrange for installation of green warning tapes directly over piping and at outside edges of underground manholes.

1. Use warning tape or detectable warning tape over ferrous piping.
2. Use detectable warning tape over nonferrous piping and over edges of underground manholes.

3.9 FIELD QUALITY CONTROL

A. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.

1. Submit separate report for each system inspection.
2. Defects requiring correction include the following:

    a. Alignment: Less than full diameter of inside of pipe is visible between structures.
    b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
    c. Damage: Crushed, broken, cracked, or otherwise damaged piping.
    d. Infiltration: Water leakage into piping.
    e. Exfiltration: Water leakage from or around piping.

3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
4. Reinspect and repeat procedure until results are satisfactory.

B. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.

1. Do not enclose, cover, or put into service before inspection and approval.
2. Test completed piping systems according to requirements of authorities having jurisdiction.
3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
4. Submit separate report for each test.
5. Hydrostatic Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction and the following:

    a. Fill sewer piping with water. Test with pressure of at least 10-foot head of water, and maintain such pressure without leakage for at least 15 minutes.
    b. Close openings in system and fill with water.
    c. Purge air and refill with water.
    d. Disconnect water supply.
    e. Test and inspect joints for leaks.

6. Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:

    a. Test plastic gravity sewer piping according to ASTM F1417.

7. Manholes: Perform hydraulic test according to ASTM C969.

C. Leaks and loss in test pressure constitute defects that must be repaired.

D. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

3.10 CLEANING

A. Clean dirt and superfluous material from interior of piping. Flush with water.

3.11 WASTE MANAGEMENT

A. Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 333000

SECTION 33 42 00 - STORMWATER CONVEYANCE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. PE pipe and fittings.
2. Non-pressure transition couplings.
3. Manholes.
4. Catch basins.
5. Pipe outlets.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings:

1. Manholes: Include plans, elevations, sections, details, frames, and covers.
2. Catch basins. Include plans, elevations, sections, details, frames, covers, and grates.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Do not store plastic manholes, pipe, and fittings in direct sunlight.

B. Protect pipe, pipe fittings, and seals from dirt and damage.

C. Handle manholes in accordance with manufacturer's written rigging instructions.

D. Handle catch basins in accordance with manufacturer's written rigging instructions.

PART 2 - PRODUCTS

2.1 CORRUGATED-PE PIPE AND FITTINGS

A. Source Limitations: Obtain corrugated-PE pipe and fittings from single manufacturer.

B. Corrugated-PE Drainage Pipe and Fittings NPS 3 to NPS 10: AASHTO M 252 or ASTM F2648, Type S, with smooth waterway for coupling joints.

C. Corrugated-PE Pipe and Fittings NPS 12 to NPS 60: AASHTO M 294 or ASTM F2648, Type S, with smooth waterway for coupling joints.

D. Corrugated-PE Silttight Couplings: PE sleeve with ASTM D1056, Type 2, Class A, Grade 2 gasket material that mates with pipe and fittings.

E. Corrugated-PE Soiltight Couplings: AASHTO M 294, corrugated, matching pipe and fittings.

2.2 PVC PIPE AND FITTINGS (within City of Buffalo Right of Way)

A. PVC Type PSM Sewer Piping:

1. Pipe: ASTM D3034, SDR 35, PVC Type PSM sewer pipe with bell-and-spigot ends for gasketed joints.
2. Fittings: ASTM D3034, PVC with bell ends.
3. Gaskets: ASTM F477, elastomeric seals.

2.3 NONPRESSURE TRANSITION COUPLINGS

A. Comply with ASTM C1173, elastomeric, sleeve-type, reducing or transition coupling, for joining underground non pressure piping. Include ends of same sizes as piping to be joined, and corrosion-resistant-metal tension band and tightening mechanism on each end.

B. Sleeve Materials:

1. For Plastic Pipes: ASTM F477, elastomeric seal or ASTM D5926, PVC.
2. For Dissimilar Pipes: ASTM D5926, PVC or other material compatible with pipe materials being joined.

C. Unshielded, Flexible Couplings:

1. Source Limitations: Obtain unshielded, flexible couplings from single manufacturer.
2. Description: Elastomeric sleeve with corrosion-resistant-metal tension band and tightening mechanism on each end.

2.4 MANHOLES

A. Standard Precast Concrete Manholes:

1. Description: ASTM C478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section as required to prevent flotation.
4. Base Section: 8-inch minimum thickness for floor slab and 6-inch minimum thickness for walls and base riser section, and separate base slab or base section with integral floor.
5. Riser Sections: 6-inch minimum thickness, and lengths to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated, and top of cone of size that matches grade rings.
7. Joint Sealant: ASTM C990, bitumen or butyl rubber.
8. Resilient Pipe Connectors: ASTM C923, cast or fitted into manhole walls, for each pipe connection.
9. Steps: Individual FRP steps or FRP ladder, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
10. Adjusting Rings: Interlocking HDPE rings with level or sloped edge in thickness and diameter matching manhole frame and cover, and of height required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.
11. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, to match diameter of manhole frame and cover, and height as required to adjust manhole frame and cover to indicated elevation and slope.

B. Designed Precast Concrete Manholes:

1. Description: ASTM C913; designed in accordance with ASTM C890 for A-16 (AASHTO HS20-44), heavy-traffic, structural loading; of depth, shape, and dimensions indicated, with provision for sealant joints.
2. Ballast: Increase thickness of one or more precast concrete sections or add concrete to manhole as required to prevent flotation.
3. Joint Sealant: ASTM C990, bitumen or butyl rubber.
4. Resilient Pipe Connectors: ASTM C923, cast or fitted into manhole walls, for each pipe connection.
5. Steps: Individual FRP steps or FRP ladder, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of manhole to finished grade is less than 60 inches.
6. Adjusting Rings: Interlocking HDPE rings with level or sloped edge in thickness and diameter matching manhole frame and cover, and of height required to adjust manhole frame and cover to indicated elevation and slope. Include sealant recommended by ring manufacturer.
7. Grade Rings: Reinforced-concrete rings, 6- to 9-inch total thickness, to match diameter of manhole frame and cover, and of height required to adjust manhole frame and cover to indicated elevation and slope.

C. Manhole Frames and Covers:

1. Description: Ferrous; 24-inch ID by 7- to 9-inch riser with 4-inch-minimum width flange and 26-inch-diameter cover. Include indented top design with lettering cast into cover, using wording equivalent to "STORM SEWER."
2. Material: ASTM A536, Grade 60-40-18 ductile iron unless otherwise indicated.

2.5 CONCRETE

A. General: Cast-in-place concrete in accordance with ACI 318, ACI 350, and the following:

1. Cement: ASTM C150, Type II.
2. Fine Aggregate: ASTM C33, sand.
3. Coarse Aggregate: ASTM C33, crushed gravel.
4. Water: Potable.

B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A1064, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A615, Grade 60 deformed steel.

C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.

1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.

    a. Invert Slope: 1 percent through manhole.

2. Benches: Concrete, sloped to drain into channel.

    a. Slope: 4 percent.

D. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water/cementitious materials ratio.

1. Reinforcing Fabric: ASTM A1064, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A615, Grade 60 deformed steel.

2.6 CATCH BASINS

A. Standard Precast Concrete Catch Basins:

1. Description: ASTM C478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.

2. Base Section: 6-inch minimum thickness for floor slab and 6-inch minimum thickness for walls and base riser section, and separate base slab or base section with integral floor.
3. Riser Sections: 6-inch minimum thickness, and lengths to provide depth indicated.
4. Joint Sealant: ASTM C990, bitumen or butyl rubber.
5. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and shape matching catch basin frame and grate. Include sealant recommended by ring manufacturer.
6. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch-square frame and grate.
7. Steps: Individual FRP steps or FRP ladder, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of catch basin to finished grade is less than 60 inches.
8. Pipe Connectors: ASTM C923, resilient, of size required, for each pipe connecting to base section.

B. Designed Precast Concrete Catch Basins: ASTM C913, precast, reinforced concrete; designed in accordance with ASTM C890 for A-16 (ASSHTO HS20-44), heavy-traffic, structural loading; of depth, shape, and dimensions indicated, with provision for joint sealants.

1. Joint Sealants: ASTM C990, bitumen or butyl rubber.
2. Adjusting Rings: Interlocking rings with level or sloped edge in thickness and shape matching catch basin frame and grate. Include sealant recommended by ring manufacturer.
3. Grade Rings: Include two or three reinforced-concrete rings, of 6- to 9-inch total thickness, that match 24-inch-square frame and grate.
4. Steps: Individual FRP steps or FRP ladder, wide enough to allow worker to place both feet on one step and designed to prevent lateral slippage off step. Cast or anchor steps into sidewalls at 12- to 16-inch intervals. Omit steps if total depth from floor of catch basin to finished grade is less than 60 inches.
5. Pipe Connectors: ASTM C923, resilient, of size required, for each pipe connecting to base section.

C. Frames and Grates: ASTM A536, Grade 60-40-18, ductile iron designed for A-16 (AASHTO HS20-44), structural loading. Include flat grate with small square or short-slotted drainage openings.

1. Size: 24 by 24 inches minimum unless otherwise indicated.
2. Grate Free Area: Approximately 50 percent unless otherwise indicated.

2.7 PIPE OUTLETS

A. Riprap Basins: Broken, irregularly sized and shaped, graded stone in accordance with NSSGA's "Quarried Stone for Erosion and Sediment Control."

1. Average Size: NSSGA No. R-5, screen opening 5 inches (127 mm).

B. Filter Stone: In accordance with NSSGA's "Quarried Stone for Erosion and Sediment Control," No. FS-2, No. 4 screen opening, average-size graded stone.

2.8 UNDERDRAINS

A. Rigid Polyethylene (PE) Pipe:
   a. 6" diameter, dual wall, soil tight, integral bell, perforated, rigid, corrugated polyethylene (PE) pipe with necessary fittings as manufactured by Hancor, Inc., ADS, or equal. Pipe to conform to AASHTO M252 or ASTM F2648.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Excavation, trenching, and backfilling are specified in Section 312000 "Earth Moving - Site."

3.2 PIPING INSTALLATION

A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground storm drainage piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.

B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings in accordance with manufacturer's written instructions for use of lubricants, cements, and other installation requirements.

C. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.

D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.

E. Install gravity-flow, non pressure drainage piping in accordance with the following:

   1. Install piping pitched down in direction of flow.
   2. Install piping NPS 6 and larger with restrained joints at tee fittings and at changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place concrete supports or anchors.
   3. Install piping with 36-inch-minimum cover.
   4. Install PE corrugated sewer piping in accordance with ASTM D2321.

3.3 PIPE JOINT CONSTRUCTION

A. Join gravity-flow, non pressure drainage piping in accordance with the following:

   1. Join corrugated-PE piping in accordance with ASTM D3212 for push-on joints.
   2. Join dissimilar pipe materials with non pressure-type flexible couplings.

3.4 MANHOLE INSTALLATION

A. General: Install manholes, complete with appurtenances and accessories indicated.

B. Install precast concrete manhole sections with sealants in accordance with ASTM C891.

C. Where specific manhole construction is not indicated, follow manhole manufacturer's written instructions.

D. Set frames and covers to elevations indicated.

3.5 CATCH BASIN INSTALLATION

A. Construct catch basins to sizes and shapes indicated.

B. Set frames and grates to elevations indicated.

3.6 STORMWATER OUTLET INSTALLATION

A. Construct riprap of broken stone, as indicated.

B. Install outlets that spill onto grade, with flared end sections that match pipe, where indicated.

3.7 CONCRETE PLACEMENT

A. Place cast-in-place concrete in accordance with ACI 318.

3.8 CONNECTIONS

A. Connect non pressure, gravity-flow drainage piping in building's storm building drains specified in Section 221413 "Facility Storm Drainage Piping."

B. Pipe couplings, expansion joints, and deflection fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.

1. Use nonpressure-type flexible couplings where required to join gravity-flow, nonpressure sewer piping unless otherwise indicated.

    a. Unshielded flexible couplings for same or minor difference OD pipes.
    b. Unshielded, increaser/reducer-pattern, flexible couplings for pipes with different OD.
    c. Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.

3.9 CLOSING ABANDONED STORM DRAINAGE SYSTEMS

A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:

1. Close open ends of piping with at least 8-inch-thick, brick masonry bulkheads.

B. Abandoned Manholes and Structures: Excavate around manholes and structures as required and use one procedure below:

1. Remove top of manhole or structure down to at least 36 inches below final grade. Fill to within 12 inches of top with stone, rubble, gravel, or compacted dirt. Fill to top with concrete.

C. Backfill to grade in accordance with Section 312000 "Earth Moving - Site."

3.10 IDENTIFICATION

A. Materials and their installation are specified in Section 312000 "Earth Moving - Site." Arrange for installation of green warning tape directly over piping and at outside edge of underground structures.

1. Use warning tape or detectable warning tape over ferrous piping.
2. Use detectable warning tape over nonferrous piping and over edges of underground structures.

3.11 FIELD QUALITY CONTROL

A. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.

1. Submit separate reports for each system inspection.
2. Defects requiring correction include the following:

    a. Alignment: Less than full diameter of inside of pipe is visible between structures.
    b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
    c. Damage: Crushed, broken, cracked, or otherwise damaged piping.
    d. Infiltration: Water leakage into piping.
    e. Exfiltration: Water leakage from or around piping.

3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
4. Reinspect and repeat procedure until results are satisfactory.

B. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.

1. Do not enclose, cover, or put into service before inspection and approval.
2. Test completed piping systems in accordance with requirements of authorities having jurisdiction.
3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
4. Submit separate report for each test.
5. Gravity-Flow Storm Drainage Piping: Test in accordance with requirements of authorities having jurisdiction, UNI-B-6, and the following:

    a. Exception: Piping with soil tight joints unless required by authorities having jurisdiction.
    b. Option: Test plastic piping in accordance with ASTM F1417.

C. Leaks and loss in test pressure constitute defects that must be repaired.

D. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

3.12 CLEANING

A. Clean interior of piping of dirt and superfluous materials. Flush with water.

3.13 WASTE MANAGEMENT

A. A.Separate and dispose of waste in accordance with the Project’s Waste Management Plan.

END OF SECTION 334200

RAVI ENGINEERING & LAND SURVEYING, P.C.

June 14, 2024

Wendel

Readers:

This report presents the results of a geotechnical engineering investigation for the project identified above.

SUBSURFACE EXPLORATIONS

Twelve test borings were performed at the site. Eight of the borings (identified as SB-1-24 through SB-8-24) were performed for geotechnical purposes. Four of the borings (identified as BH1/MW1, BH2/MW2, BH3/MW3, and BH5) were performed primarily for environmental purposes.

The approximate locations of the 12 borings are shown on the plans in attached Appendix A.

All 12 borings were performed using rotary drilling equipment.

The eight geotechnical borings were performed by Earth Dimensions, between 4/24/24 and 4/26/24. The logs of the borings were prepared by Earth Dimensions, and are presented in attached Appendix B.

The four environmental borings were performed by NW Contracting, between 4/9/24 and 4/11/24. The logs of the borings were prepared by Ravi Engineering & Land Surveying, and are presented in attached Appendix C.

It should be noted that short-term observations may not be representative of actual groundwater levels, and that groundwater levels will vary with factors including location, time, precipitation, season, and site activities.

DESIGN AND CONSTRUCTION

General

All design and construction should meet or exceed the requirements of all applicable codes.

With regard to the Building Code of New York State, a seismic Site Class of "C" should be applied to this project. This corresponds to a "Very dense soil and soft rock" profile.

New Foundations on Rock

All of the following requirements should be satisfied:

- A foundation on rock should bear directly on sound limestone bedrock, below any severely weathered or fractured zones.
- The bearing surface should be relatively level, with a slope no steeper than 1 vertical on 10 horizontal.
- Individual column foundations should be designed for a bearing pressure of 50,000 pounds per square foot or less, and should in no case be less than 30 inches in width or diameter.
- Continuous wall foundations should be designed for a bearing pressure of 50,000 pounds per square foot or less, and should in no case be less than 24 inches in width.
- At any location where a new foundation will meet an existing foundation, the foundations should bear at the same elevation.
- The imaginary slope between the bottom edges of any two foundations should be no steeper than 1 vertical on 2 horizontal.
- Any stepped wall foundations should be stepped in vertical increments of 12 inches or less, and horizontal increments of 24 inches or more.

The approximate depths and elevations of the top of limestone bedrock, at the boring locations, are presented in the attached table.

New Foundations on Soil or Compacted Fill

All of the following requirements should be satisfied:

- No existing fill, organic matter, loose or soft natural soil, pavement, concrete, existing utilities, or other unsuitable materials should be left in place below a foundation.

- Foundations should bear on suitable natural soil, or on compacted granular fill.

- Any granular fill below a foundation should be placed directly on suitable natural soil or bedrock. The granular fill should extend laterally beyond each edge of the foundation, a distance at least as great as the vertical thickness of granular fill below the foundation.

- Subgrades should be prepared, and granular fill should be placed and compacted, as described elsewhere in this report.

- Individual column foundations should be designed for a bearing pressure of 3,000 pounds per square foot or less, and should in no case be less than 36 inches wide.

- Continuous wall foundations should be designed for a bearing pressure of 3,000 pounds per square foot or less, and should in no case be less than 24 inches wide.

- Foundations should be seated at least 4 feet below the lowest adjacent final surface exposed to freezing temperatures.

- At any location where a new foundation will meet an existing foundation, the foundations should bear at the same elevation.

- The imaginary slope between the bottom edges of any two foundations should be no steeper than 1 vertical on 2 horizontal.

- Any stepped wall foundations should be stepped in vertical increments of 12 inches or less, and horizontal increments of 24 inches or more.

The approximate depths and elevations of the top of suitable natural bearing soil, at the boring locations, are presented in the attached table.

Settlement of New Foundations

The total settlement of any new foundation, if properly designed and constructed in accordance with this report, is not expected to exceed 1 inch.

The settlements of foundations on soil or compacted fill are likely to be greater than the settlements of foundations on rock. Differential settlements may approach 1 inch, particularly if both foundation types are used.

Load Increases on Existing Foundations

If the loads on any existing foundations are to be increased, the existing foundations should satisfy the requirements for new foundations, as described elsewhere in this report. Geotechnical and structural evaluations may be necessary, and could include some or all of the following:

- An assessment of the previous performance of the existing foundations
- A review of drawings for the existing structure
- A comparison of previous and proposed dead and live loads
- Visual inspections and measurements
- Coring and testing of existing concrete
- Probing and sampling, through and/or beside existing foundations, to check the suitability of the underlying material

New Floor Slabs on Grade

Based on the borings, it appears that the subgrades below any new floor slabs on grade will consist of random fill materials.

At least 12 inches of compacted granular fill should be placed beneath all floor slabs. Drained, unsaturated conditions should be maintained within the granular fill. Subgrades should be prepared, and granular fill should be placed and compacted, as described elsewhere in this report.

For a well-prepared subgrade, an appropriate subgrade modulus (K) would be 75 pounds per cubic inch. The effective modulus, at the top of at least 12 inches of compacted granular fill, could be taken as 150 pounds per cubic inch.

Floor slabs should be designed and constructed in accordance with ACI recommendations.

Lateral Earth Pressures and Sliding Resistance

Backfill should consist of compacted granular fill, as described elsewhere in this report. For purposes of analysis and design, the following are recommended:

- Total soil unit weight: 125 pounds per cubic foot
- Buoyant or submerged soil unit weight: 65 pounds per cubic foot
- Soil internal friction angle: 30 degrees

- Active lateral earth pressure coefficient: 0.33
- At-rest lateral earth pressure coefficient: 0.50
- Passive lateral earth pressure coefficient: 3.00
- Ultimate coefficient of sliding friction, un-formed concrete on soil or rock: 0.50

Excavation

Excavation should be performed in accordance with all applicable local, state, and federal requirements. The sides of all excavations should be sloped or supported as required by safety regulations. Existing structures, utilities, and other property should be protected.

With regard to the current OSHA regulations, Type C soil should be assumed. This would apply to adequately dewatered soil.

To minimize subgrade disturbance, excavation should be performed with increasing care as subgrade levels are approached.

Rock excavation will generally require that the rock be broken and loosened before it is removed. Special methods (such as hoe-ramming and/or drilling) are likely to be necessary. Blasting is not recommended.

Construction Dewatering

All work should be performed in the dry. In addition, the dewatering should be sufficient to permit suitable preparation of the subgrade and compaction of any subsequent fill materials.

The contractor should be prepared to dewater as necessary, and should choose and employ an appropriate type of dewatering system. Any dewatering system should be operated in such a way that disturbance or removal of the subgrade soil does not occur.

Preparation of Soil Subgrades

It is cautioned that the soils at this site contain fine-grained material, and that they will be sensitive to disturbance. Subgrades should be kept free of water, subjected to a minimum amount of construction traffic, exposed no longer than necessary, and not permitted to freeze.

Subgrades should be carefully prepared and thoroughly examined by qualified personnel, tamped using vibratory equipment (to the greatest extent practical without loosening or softening the subgrade soils), and proof rolled (where space permits) using a fully loaded ten-wheel dump truck or full-size roller.

No new fill or foundation concrete should be placed over material that is loose, soft, wet, frozen, or otherwise unsuitable with respect to the design recommendations.

A soil subgrade below a foundation should consist of inorganic natural soil.

The subgrade below a floor slab is likely to consist of existing fill. It should contain no more than trace amounts of organic matter.

Granular Fill and Backfill

Granular fill should consist of a durable sand and gravel or crusher-run stone, free of any organic matter. The plasticity index should be less than 5. Granular fill should have 100 percent finer than 3 inches, 20 to 60 percent finer than the Number 4 sieve, and no more than 10 percent finer than the Number 200 sieve.

Granular fill could also be specified as meeting the NYSDOT requirements for Subbase Course Type 1, 2, or 4.

Granular fill should be compacted, in lifts of 9 inches or less, to at least 95 percent of the maximum dry density determined by ASTM D 1557.

The in-place density and water content of compacted fill should be determined by ASTM D 6938. For any compacted fill below wall footings, at least one test should be performed per 50 lineal feet of wall, per lift. For any compacted fill below column footings, at least one test should be performed per footing, per lift. For other areas such as floor slabs, at least one test should be performed per 2,500 square feet, per lift.

CLOSING COMMENTS AND RECOMMENDATIONS

Professional services for this investigation were performed in accordance with generally accepted geotechnical engineering practices, exclusively for the subject project. No warranty, expressed or implied, is made.

It should be noted that subsurface conditions are inferred from the logs of subsurface explorations; that each subsurface exploration is performed at a specific location and time; that conditions between, beyond, and below explorations are likely to vary; that conditions are often described on the basis of visual examinations of recovered samples; that visual descriptions may not always agree well with descriptions made on the basis of laboratory tests; that the distinction between fill and naturally-deposited soil can not always be readily determined on the basis of recovered samples; and that conditions can be changed by excavation and/or filling, performed after the exploration. If subsurface conditions are subsequently revealed that appear to be significantly different or less favorable than those described, we should be given the opportunity to revise the statements in this report.

Designers and contractors are advised that this report was prepared primarily for design purposes, and that it may not contain sufficient information for bidding. Contractors should visit the site, review this report and the related exploration logs, and evaluate potential construction difficulties on the basis of their own knowledge and experience.

It is recommended that qualified personnel be retained to review the geotechnical portions of the contract drawings and specifications, and to provide monitoring services during construction.

If you have questions or comments regarding this report, please contact the undersigned.

Yours truly,

RAVI ENGINEERING & LAND SURVEYING, P.C.

Nagappa Ravindra, P.E.
President

Ray M. Teeter, P.E.

S.U.E. UTILITY NOTES:

1. UNDERGROUND UTILITY MARK OUT AND SURVEY COMPLETED ON FEBRUARY 21, 2024 WITH CLEAR SITE CONDITIONS AT THE TIME OF SURVEY.
2. UTILITIES DEPICTED ON THESE PLANS ARE FROM S.U.E. STAKE OUT, UTILITY OWNER'S RECORDS SUPPLEMENT THE PLAN AS NEEDED.
3. RAVI MAKES NO GUARANTEE THAT THE UNDERGROUND UTILITIES SHOWN COMPRISE ALL SUCH UTILITIES IN THE AREA, EITHER IN SERVICE OR ABANDONED. RAVI FURTHER DOES NOT WARRANT THAT THE UNDERGROUND UTILITIES SHOWN ARE IN THE EXACT LOCATION INDICATED, ALTHOUGH WE DO CERTIFY THAT THEY ARE DESIGNATED AS ACCURATELY AS POSSIBLE FROM INFORMATION AVAILABLE.
4. WITH DUE DILIGENCE, RAVI WILL MAKE EVERY REASONABLE EFFORT TO DESIGNATE SUBSURFACE UTILITIES; HOWEVER, RAVI CANNOT GUARANTEE THAT ALL ACTIVE OR ABANDONED UTILITIES AND STRUCTURES CAN OR WILL BE DETECTED, INCLUDING BUT NOT LIMITED TO, UTILITIES LOCATED UNDERNEATH OTHER UTILITIES AND NON-CONDUCTIVE UTILITY STRUCTURES.
5. RAVI WILL NOT BE RESPONSIBLE FOR ANY UTILITY INFORMATION OUTSIDE THE AREAS DEFINED IN THIS SCOPE.
6. CLIENT SHOULD BE AWARE THAT THE EFFECTIVENESS OF GPR TO DESIGNATE THE EXISTENCE OF A SUBSURFACE UTILITY IS DEPENDENT ON THE SOIL AND GROUND WATER CONDITIONS. SOILS WITH SIGNIFICANT CLAY CONTENT AND HIGH MOISTURE CONTENT WILL ATTENUATE (ABSORB) THE GPR SIGNAL, WHICH SIGNIFICANTLY REDUCES OUR ABILITY TO IDENTIFY SUBSURFACE UTILITIES.
7. USE OF RAVI FOR SUBSURFACE UTILITY ENGINEERING (S.U.E.) DOES NOT RELIEVE THE CLIENT, CONTRACTOR(S) OR UTILITY OWNER(S) OF THE RESPONSIBILITY OF NOTIFYING DIG SAFELY NEW YORK SYSTEM PRIOR TO STARTING EXCAVATION. RAVI WILL NOT BE ASSUMED OR HELD RESPONSIBLE FOR DAMAGES TO UTILITIES CAUSED BY OTHERS.
8. S.U.E. FIELD WORK WAS ASSISTED BY PLANS PROVIDED BY THE UTILITY OWNERS. THE ACTUAL LOCATION OF THE UTILITIES MAY VARY. UTILITIES MAY EXIST THAT ARE NOT SHOWN ON THESE PLANS. IT IS THE RESPONSIBILITY OF THE CONTRACTOR AT TIME OF CONSTRUCTION TO IDENTIFY, VERIFY, AND SAFELY EXPOSE THE UTILITIES ON THIS PROJECT.
9. RAVI WARRANTS ONLY THAT THE SERVICES PROVIDED UNDER THIS PROPOSAL WILL MEET THE PREVAILING STANDARD OF CARE AND DOES NOT GUARANTEE THAT ALL UTILITIES CAN OR WILL BE IDENTIFIED, DETECTED OR PRECISELY MAPPED.
10. RAVI WILL NOT BE ASSUMED OR HELD RESPONSIBLE FOR DAMAGES TO UTILITIES CAUSED BY OTHERS.
11. IDENTIFYING AND MAPPING UNDERGROUND UTILITIES IS A RESULT OF GATHERING EVIDENCE AND THEREFORE EXACT UTILITY LOCATIONS ARE NOT GUARANTEED UNLESS VISUALLY EXPOSED AND SURVEYED, AND THEN ONLY AT THOSE SPECIFIC EXPOSED LOCATIONS.
12. UTILITY DEPTHS SHOWN WERE DETERMINED UTILIZING GEOPHYSICAL DEVICES AND SHOULD BE CONSIDERED APPROXIMATE. TO VERIFY SIZES, TYPES, AND DEPTHS THE SUBSURFACE UTILITIES SHOULD BE EXPOSED AND MEASURED.
13. THE SUBSURFACE UTILITIES SHOWN HEREON ARE OF QUALITY LEVEL "B" AS DEFINED BY THE AMERICAN SOCIETY OF CIVIL ENGINEERS (ASCE) IN THE "STANDARD GUIDELINES FOR THE COLLECTION AND DEPICTION OF EXISTING SUBSURFACE UTILITY DATA."

Preface

A Limited Pre-Renovation Hazardous Materials Inspection consisting of a Limited Pre-Renovation Asbestos Survey/Inspection, Limited Polychlorinated Biphenyl (PCB) Material Survey, and Limited Lead Material Survey has been completed at 631 Northland Avenue, Buffalo, New York 14221. The results are included in this report and are presented in three (3) volumes, namely:

Volume 1 of 3: Limited Pre-Renovation Asbestos Survey/Inspection

Volume 2 of 3: Limited PCB Material Survey

Volume 3 of 3: Limited Lead Material Survey

EXECUTIVE SUMMARY

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Pre-Renovation Asbestos Survey/Inspection at 631 Northland Avenue, Buffalo, New York 14221. The initial Survey/Inspection was conducted from January 31 through February 1, 2024.

The scope of work was based on electronic correspondence between RE&LS and Wendel from July 2023 with follow-up correspondence in December 2023. Drawings of the building design from 1953 were provided by Wendel and included a ground floor and roof plan. As well as, detailed designs of the toilet rooms, furnace room, plumbing and the heating and ventilation systems. The Survey/Inspection included the entire structure with exception of the roof.

TABLE 1 – ASBESTOS SUMMARY TABLE

ASBESTOS-CONTAINING MATERIALS AND LOCATIONS
White exterior window glazing- exterior windows
Gray caulk- interior bay door
Gray quarry tile grout- toilet room
Light gray thin set- toilet room
Dark gray interior window caulk- interior windows
TRACE ASBESTOS-CONTAINING MATERIALS AND LOCATIONS
Light blue spray-on coating- plastic divider and floor around furnace control room
ASSUMED ASBESTOS-CONTAINING MATERIALS AND LOCATIONS
White hard insulation- exterior furnace
White steam pipe insulation- interior ceiling mount and connecting pipes
White rope gasket- on and around interior furnace
White mud fittings- pipe insulation
NON-ASBESTOS-CONTAINING MATERIALS
Black creosote on wood block flooring
Gray joint mortar on floor
Black caulk around flooring
Gray interior bay door caulk
White furnace insulation
White doorstop caulk
Brown quarry tile
Gray exterior window caulk
Gray exterior expansion joint caulk
Black exterior expansion joint caulk
White kiln fire brick
Black railroad track caulk
Dark gray interior window caulk
Black wire insulation
Tan fire brick- inside furnace
Light brown fire coating inside furnace
White exterior bay door caulk

White caulk around exhaust
Black exterior hopper sleeve
White exterior bay door caulk- by furnace

[1] *Trace amounts of Actinolite/tremolite indicate the presence of asbestos fibers. Although the trace material is not an asbestos-containing material, RE&LS recommends that this trace material be treated, handled and disposed of as an asbestos- containing material.*

Asbestos-containing materials (ACMs), assumed ACMs, and trace ACMs were identified in the proposed renovation areas. Locations of ACMs, assumed ACMs and trace ACMs are shown on the Asbestos Location Plans in Attachment B.

No renovation, renovation, remodeling, or repair work shall commence by any owner or owner's agent in areas where ACMs and/or suspect ACMs exist prior to the completion of asbestos abatement. The Construction Manager shall notify all subcontractors of the presence and locations of ACMs and suspect ACMs consistent with Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101. Suspect ACMs, not identified in this Survey/Inspection report, discovered during renovation or renovation activities shall be assumed to contain asbestos until laboratory analysis proves otherwise.

1.0 INTRODUCTION

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Pre-Renovation Asbestos Survey/Inspection at 631 Northland Avenue, Buffalo, New York 14221. Certified Asbestos Inspectors assessed interior and exterior spaces for suspect asbestos-containing building materials that will be impacted by the proposed renovation project to determine the presence, location, quantity, and condition of asbestos-containing materials (ACMs). The initial Survey/Inspection was conducted from January 31 through February 1, 2024.

2.0 PROJECT OVERVIEW

The Survey/Inspection was conducted to support the renovation project of 631 Northland Avenue, Buffalo, New York. The scope of work was based on electronic correspondence between RE&LS and Wendel from July 2023 with follow-up correspondence in December 2023. Drawings of the building design from 1953 were provided by Wendel and included a ground floor and roof plan. As well as, detailed designs of the toilet room, furnace room, plumbing and the heating and ventilation systems. The Survey/Inspection included the entire structure with exception of the roof.

3.0 RECORD REVIEW

RE&LS reviewed the lab results of samples taken by Fisher Associates and analyzed by AmeriSci Richmond in July, 2015, to determine the extent of material sampling previously performed at 631 Northland Avenue. A copy of the report is included in Attachment F.

4.0 SITE INSPECTION

The Survey/Inspection began with a visual assessment to identify homogeneous areas (HAs) that exist within the proposed renovation areas. The United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) regulations define an HA as, "…an area of surfacing material, thermal system insulation material, or miscellaneous material that is uniform in color and texture." Further, HAs should be collected from each construction vintage (age) independently, even if newly constructed.

The Inspectors identified HAs that were present in each inspected location. Each HA was given a number corresponding to the identified material. HA numbers used by RE&LS in this Survey/Inspection were given the following alpha-numeric coding:

1A	Homogeneous Area Number 1, sample A (A, B, C, etc. refer to the total amount of samples collected for that HA based on AHERA sampling protocol)

Given this alpha-numeric coding, sample 1A can be identified as: *White exterior window glazing*, first sample. The areas of inspection applicable to this report are shown on the Sample Location Plans in Attachment A. HA numbers used for asbestos bulk sampling are listed in Table 2.

Twenty-eight (28) HAs, based on color and texture, were identified, of which fifty-two (52) samples were collected and submitted to Paradigm Environmental Services, Inc. (Paradigm) for asbestos analysis.

TABLE 2 – HOMOGENEOUS AREAS

Homogeneous Area No. (HA)	Material Description
1	White exterior window glazing
2	Black creosote on wood block flooring
3	Gray joint mortar on floor
4	Light blue spray-on coating
5	Black caulk around flooring
6	Gray caulk- interior bay door
7	White furnace insulation
8	White doorstop caulk
9	Gray quarry tile grout
10	Brown quarry tile
11	Light gray thin set
12	Gray exterior window caulk
13	Gray exterior expansion joint caulk
14	Black exterior expansion joint caulk
15	White kiln fire brick
16	Black railroad track caulk
17	Dark gray interior window caulk
18	Black wire insulation
19	Tan fire brick- inside furnace
20	Light brown fire coating inside furnace
21	White exterior bay door caulk
22	White caulk around exhaust
23	Black exterior hopper sleeve
24	White exterior bay door caulk- by furnace
25	White hard insulation
26	White steam pipe insulation
27	White rope gasket
28	White mud fittings

5.0 ASBESTOS BULK SAMPLING

RE&LS is a New York State Licensed Asbestos Contractor employing New York State Department of Health (NYSDOH)/USEPA Certified Asbestos Inspectors. Asbestos bulk sampling procedures were performed in compliance with all applicable Occupational Safety and Health Administration (OSHA), USEPA, and New York State (NYS) sampling protocols.

Bulk sample analysis was performed by Paradigm, an NYSDOH-approved laboratory. Friable samples were analyzed using NYS Environmental Laboratory Approval Program (ELAP) Method EPA 600/M4/82/020 Polarized Light Microscopy (PLM). Non-friable organically bound (NOB) samples were analyzed using NYS ELAP Method 198.6 PLM and, if found to be less than or equal to 1% asbestos by weight, NYS ELAP Method 198.4 Transmission Electron Microscopy (TEM). A copy of Paradigm's Certification is included in Attachment G.

6.0 ASBESTOS-CONTAINING MATERIALS AND LOCATIONS

ACMs, assumed ACMs, and trace ACMs were identified within the proposed renovation areas.

Table 3 identifies the ACMs, assumed ACMs and Trace ACM along with their descriptions, sample numbers, asbestos content, and approximate quantities. Locations of the ACMs are shown on the Asbestos Location Plans in Attachment B.

TABLE 3 – ASBESTOS-CONTAINING MATERIALS AND LOCATIONS

Homogeneous Area No. (HA)	Material Description and Location	Sample Numbers	Asbestos Content and Type of Analysis	Approximate Quantity
1	White window glaze- exterior windows	1A 1B 1C 1D	Chrysotile 1.3%-PLM Chrysotile-1.9%-TEM Chrysotile 2.6%-TEM Chrysotile 2.9%-TEM	3,425 SF
6	Gray caulk-interior bay door	6A 6B	Chrysotile 6.2%-PLM Chrysotile 4.3%-PLM	5 SF
9	Gray grout- toilet room	9A 9B	Chrysotile 1.5%-PLM Chrysotile 1.8%-PLM	1,612 SF
11	Light gray thin set- toilet room	11A 11B	Chrysotile 1.2%-PLM Chrysotile 1.5%-PLM	1,612 SF
17	Dark gray caulk- interior window frames	17A 17B	Chrysotile 2.8%-PLM Chrysotile 2.3%-PLM	3,425 SF
TRACE ASBESTOS-CONTAINING MATERIALS				
4[1]	Light blue spray-on coating- plastic divider and flooring around furnace control room	4A 4B 4C	Actinolite/Tremolite <1.0%-TEM Actinolite/Tremolite <1.0%-TEM Actinolite/Tremolite <1.0%-TEM	150 SF
PREVIOUSLY IDENTIFIED ASBESTOS-CONTAINING MATERIALS				
4[2]	White hard insulation- inside exterior furnace	4A 4B	2.0% Chrysotile – PLM NA/PS	4,800 SF
6[2]	White steam pipe insulation- interior ceiling mount and connecting pipes	6A	17.6% Chrysotile / 5.9% Amosite - PLM	1,700 LF

Homogeneous Area No. (HA)	Material Description and Location	Sample Numbers	Asbestos Content and Type of Analysis	Approximate Quantity
13[2]	Roof – Black Flashing Cement on Doors & Equipment	13A 13B	2.3% Chrysotile – PLM NA/PS	TBD
15[2]	White rope gasket-on and around interior furnace	15A	36.4% Chrysotile - PLM	5 SF
28	White mud fittings-pipe insulation	NA	Assumed	105 LF

[1] Trace amounts of Actinolite/Tremolite indicate the presence of asbestos fibers. Although this trace material is not an asbestos-containing material, RE&LS recommends that this trace material be treated, handled and disposed of as an asbestos-containing material.
[2] Samples were collected by Fisher Associates in 2015. Results for these samples are located in Attachment F
LF: Linear Feet
SF: Square Feet
PLM: Polarized Light Microscopy
TEM: Transmission Electron Microscopy
N/A: Not Applicable

7.0 LIMITATIONS OF THE INVESTIGATION

The Survey/Inspection included the spaces outlined in Section 2.0 Project Overview. Areas that were inaccessible, listed below, were not sampled nor identified. Suspect ACMs, not identified in this Survey/Inspection report, discovered during renovation or renovation activities shall be assumed to contain asbestos until laboratory analysis proves otherwise.

- Area below the “Rotoblast”
- Inside of the exterior furnace
- Electrical and switch boxes due to live electric in the building

8.0 FIELD NOTES

The following field notes were recorded by the Inspectors to strengthen the knowledge of the building materials and systems present. In most cases, the field notes capture observations that are not documented on the asbestos chain of custody forms or sample location drawings:

Interior

- A large portion of the tan/clear window panes are a plastic material.
- A sand pit is located in the northwest corner of the building.
- An underground hatch was located to the right of the furnace, hatch only opened approximately 3 inches due to rust making the area below inaccessible.
- Interior of the “Rotoblast” was fully metal and no caulks were observed.
- No vermiculite was noted coming from the holes in the concrete block walls.

- Rope gaskets and wire insulation were noted on both sides of the furnace.
- Fire doors noted to be hallow.
- Switch boxes and electrical boxes are considered to be suspect ACM, but were not sampled due to live electrical in the building.

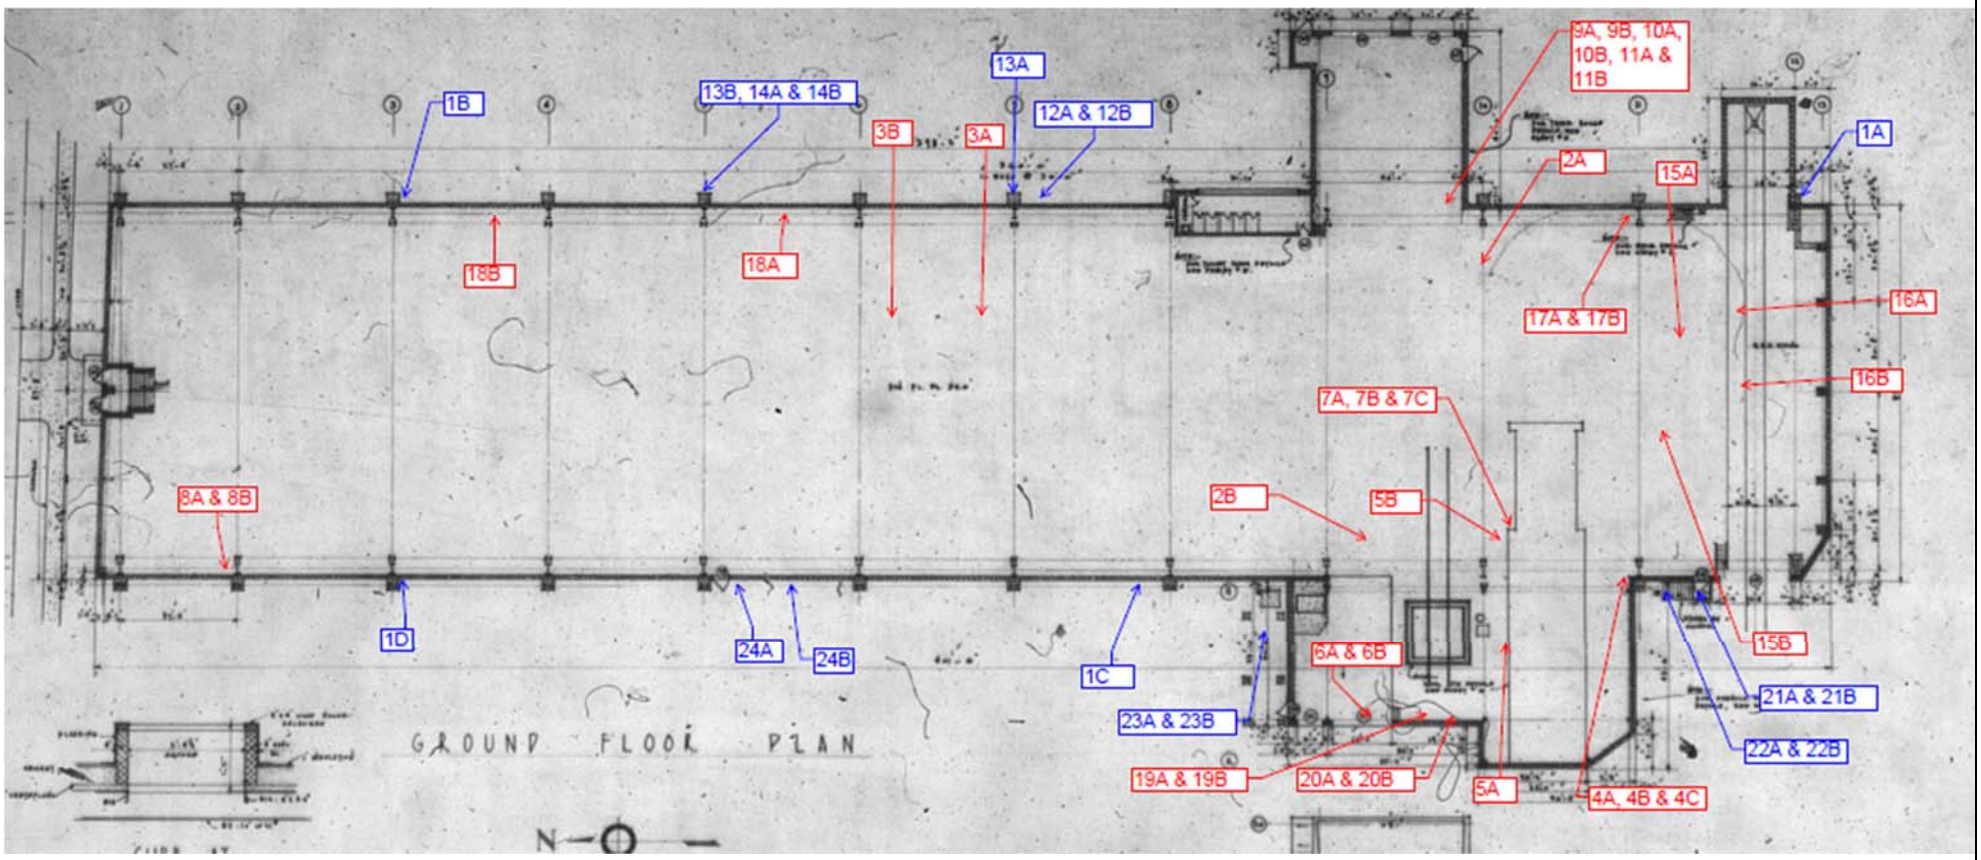
Exterior

- The black joint filler (HA14) was only noted in sample location, it was not found in other exterior joints.
- White “fluffy” insulation inside of the exterior furnace was observed via a small approximately 3 feet inside the furnace. Insulation was not in reach to be able to sample and there was no other access inside of the furnace.

9.0 CONCLUSIONS

A Limited Pre-Renovation Asbestos Survey/Inspection was conducted at 631 Northland Avenue, Buffalo, New York 14221. The Survey/Inspection was based on the scope items as described in Section 2.0 Project Overview.

ACMs, assumed ACMs, and trace ACMs have been identified in the proposed renovation areas. Materials containing trace amounts of asbestos are not required to be handled or disposed of as an ACM. Locations of ACMs and assumed ACM are shown on the Asbestos Location Plans in Attachment B.



No renovation, renovation, remodeling, or repair work shall commence by any owner or owner’s agent in areas where ACMs and/or suspect ACMs exist prior to the completion of asbestos abatement. The Construction Manager shall notify all subcontractors of the presence and locations of ACMs and suspect ACMs consistent with Occupational Safety and Health Administration (OSHA) regulation 29 CFR 1926.1101. Suspect ACMs, not identified in this Survey/Inspection report, discovered during renovation or renovation activities shall be assumed to contain asbestos until laboratory analysis proves otherwise.

KEY TO NOB COLUMN SYMBOLS
No Symbol in the NOB column denotes sample analyzed by ELAP Method 198.1 (PLM).
√ NOB (non-friable organically bound)denotes material analyzed by ELAP Method 198.6 (PLM) and 198.4 (TEM) as noted.
V̌ denotes material analyzed by ELAP Method 198.6 (PLM) per NYSDOH. This Method does not remove vermiculite and may underestimate the level of asbestos present in a sample containing greater than 10% vermiculite.
 # denotes friable material analyzed by ELAP Method 198.6 (PLM) and 198.4 (TEM) as noted.
X denotes sample prepped only by ELAP Method 198.6.
**** Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos containing.**

PLM Bulk Asbestos Analysis by New York State Department of Health, ELAP Method 198.1 ,198.4 and 198.6 ("Polarized Light Microscopy and Transmission Electron Microscopy Methods for Identifying and Quantitating Asbestos in Bulk Samples and in Non-Friable Organically Bound Bulk Samples.")or EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200530-0),

Reviewed by: _____ Date Reviewed: _____ Analyzed By: Beverly A. Schrage Date Analyzed: 7/7/2015

Semi-Quantitative Analysis: NAD = no asbestos detected; NA = not analyzed; NA/PS = not analyzed due to positive stop; Trace = <1%;
PLM analysis by EPA 600/R-93/116 per 40 CFR 763 (NVLAP Lab Code 101904-0) or NY ELAP 198.1 for New York friable samples which includes quantitation of any vermiculite observed (198.6 for NOB samples) or EPA 400 pt ct by EPA 600/M4-82-020 (NY ELAP Lab # 10984);
TEM analysis by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation); or NY ELAP 198.4 for New York NOB samples (NY ELAP Lab # 10984);

** Warning Notes: Consider PLM fiber diameter limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris, soils or other heterogeneous materials for which a combination PLM/TEM evaluation is recommended; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only.

PLM Bulk Asbestos Report

154034; 631 Northland; 631 Northland Ave, NY

Reporting Notes:

Analyzed by: Donna M. Blackwell Donna M Blackwell Date 7/6/15

*NAD = no asbestos detected, Detection Limit <1%, Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; "Present" or NVA = "No Visible Asbestos" are observations made during a qualitative analysis; NA = not analyzed; NA/PS = not analyzed / positive stop; PLM Bulk Asbestos Analysis by EPA 600/R-93/116 per 40 CFR 763 (NVLAP Lab Code 101904-0) and ELAP PLM Analysis Protocol 198.1 for New York friable samples which includes quantitation of any vermiculite observed (198.6 for NOB samples) or EPA 400 pt ct by EPA 600/M4-82-020 (NYSDOH ELAP Lab # 10984); CA ELAP Lab # 2508; Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the laboratory. This PLM report relates ONLY to the items tested.

EXECUTIVE SUMMARY

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Polychlorinated Biphenyl (PCB) Material Survey at 631 Northland Avenue, Buffalo, New York 14211. The Survey was conducted from January 31 through February 1, 2024.

The Survey included a visual assessment and collection of suspect caulks and other materials that would be impacted by the proposed renovation project. Materials were sampled for PCB content to determine if special removal or disposal procedures are required.

The caulks that were sampled and analyzed for asbestos content (identified in Volume 1 of this report) were also sampled and analyzed for PCBs. Fifteen (15) material samples were collected and submitted to Paradigm Environmental Services, Inc. for PCB analysis. Two (2) out of fifteen (15) samples were determined to be PCB-containing.

1.0 INTRODUCTION

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Polychlorinated Biphenyl (PCB) Material Survey at 631 Northland Avenue, Buffalo, New York 14211. The Survey was conducted from January 31 through February 1, 2024.

2.0 PROJECT OVERVIEW

The Survey was conducted to support the renovation project of 631 Northland Avenue, Buffalo, New York. The scope of work was based on electronic correspondence between RE&LS and Wendel from July 2023 with follow-up correspondence in December 2023. Drawings of the building design from 1953 were provided by Wendel and included a ground floor and roof plan. As well as, detailed designs of the toilet room, furnace room, plumbing and the heating and ventilation systems. The Survey included the entire structure with exception of the roof.

3.0 PCB SAMPLING/FINDINGS

Fifteen (15) material samples were collected and submitted to Paradigm Environmental Services, Inc. (Paradigm) for PCB analysis. A copy of Paradigm's Certification is included in Attachment D. Bulk sample locations are included in Attachment A. Table 1 identifies the materials that were sampled and analyzed for PCBs along with the sample number, material description, location, and PCB content.

Table 1 – PCB MATERIAL SAMPLING RESULTS

Sample Number	Material Description and Location	PCB Content (ppm)
Wood Floor-1	Wood block floor- southeast corner	BDL
Wood Floor- 2	Wood block floor- northwest corner	BDL
Wood Floor- 3	Wood block floor- northwest corner	BDL
1P	White glazing- exterior window	BDL
2P	Black floor coating- wood blocks	BDL
5P	Black caulk- around floor	BDL
6P	Gray caulk- interior bay door	BDL
8P	White caulk- under door threshold	**PCB-1254- 4.07**
12P	Gray caulk- interior toilet room window	BDL
13P	Gray expansion joint caulk- exterior	BDL
16P	Black caulk- railroad track	BDL
17P	Dark gray caulk- interior window	**PCB-1254- 5.63** **PCB-1260- 19.2**
21P	White caulk- exterior bay door	BDL
22P	White caulk- around exterior exhaust	BDL
24P	White caulk- exterior bay door behind furnace	BDL

Note: The above identified caulks were also analyzed for asbestos content as identified in Volume 1 of this report.
ppm: Parts Per Million
BDL: Below Detection Limit
***Bold**: PCB-containing*

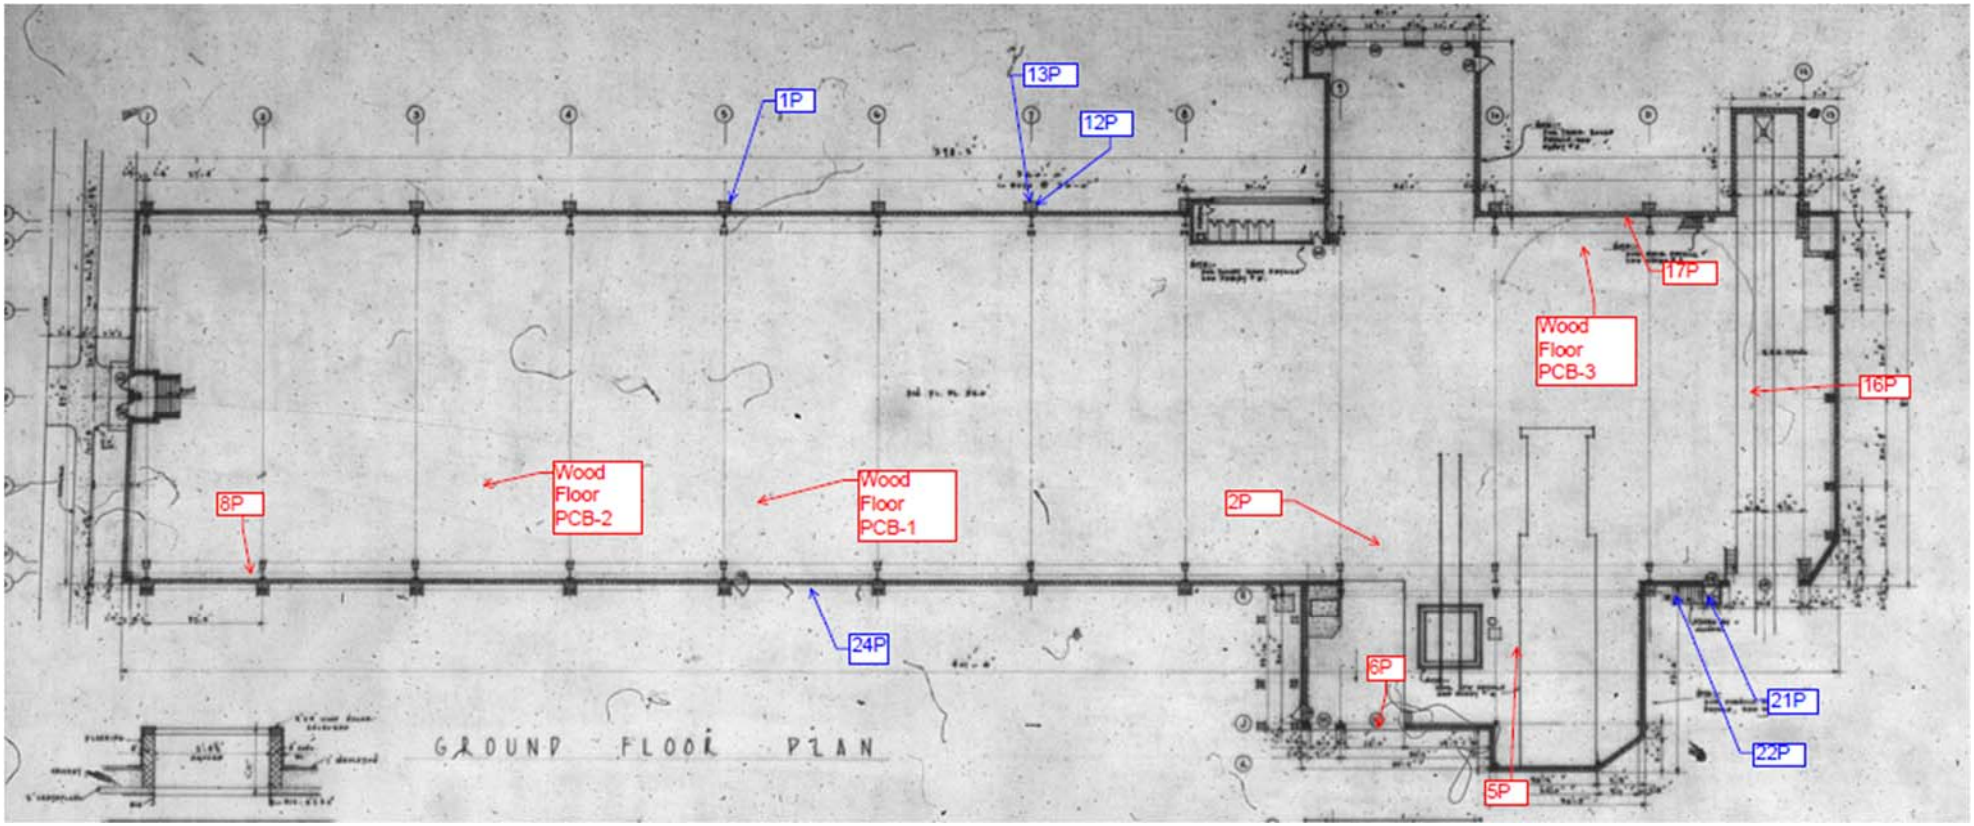
Two (2) of the fifteen (15) analyzed samples were found to be PCB-containing, but are below the regulatory threshold for PCB bulk-product waste (≥50 parts per million; ppm). The United States Environmental Protection Agency (USEPA) defines PCB bulk-product waste as "waste derived from

manufacturing products containing PCBs in a non-liquid state, at any concentration where the concentration at the time of designation for disposal was ≥50 ppm PCB."

4.0 LIMITATIONS OF INVESTIGATION

The Survey was based on the project scope as described in Section 2.0 Project Overview. Areas that were inaccessible were not sampled nor identified.

5.0 RECOMMENDATIONS



Two (2) of the fifteen (15) materials that were sampled and analyzed were determined to be PCB-containing, but are not above the USEPA threshold. Suspect caulks and other materials, not identified in this Survey report, discovered during renovation or renovation activities shall be assumed to be PCB-containing until laboratory analysis proves otherwise.

This report is part of a multipage document and should only be evaluated in its entirety. The Chain of Custody provides additional sample information, including compliance with the sample condition requirements upon receipt.

Analytical Report Appendix

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.
"E" = Result has been estimated, calibration limit exceeded.
"H" = Denotes a parameter analyzed outside of holding time.
"Z" = See case narrative.
"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.
"J" = Result estimated between the quantitation limit and half the quantitation limit.
"L" = Laboratory Control Sample recovery outside accepted QC limits.
"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.
"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.
"" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.*
"(1)" = Indicates data from primary column used for QC calculation.
"A" = denotes a parameter for which ELAP does not offer approval as part of their laboratory certification program.
"F" = denotes a parameter for which Paradigm does not carry certification, the results for which should therefore only be used where ELAP certification is not required, such as personal exposure assessment.

GENERAL TERMS AND CONDITIONS
LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written, between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, term or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty. Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.
Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices. Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately. Evaluation and reporting of initial screening runs may incur additional fees.

Limitations of Liability. In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to re-perform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.
LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.
All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.
Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure. Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance with applicable laws.

Sample Handling. Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises.
Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.
Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.
LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment. LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure. LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law. This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.

Analytical Report Appendix

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.
"E" = Result has been estimated, calibration limit exceeded.
"Z" = See case narrative.
"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.
"J" = Result estimated between the quantitation limit and half the quantitation limit.
"L" = Laboratory Control Sample recovery outside accepted QC limits.
"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.
"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.
"" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.*
"(1)" = Indicates data from primary column used for QC calculation.

GENERAL TERMS AND CONDITIONS
LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written, between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, tern or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty. Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.
Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices. Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately. Evaluation and reporting of initial screening runs may incur additional fees.

Limitations of Liability. In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to re-perform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.
LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.
All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.
Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure. Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance with applicable laws.

Sample Handling. Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises.
Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.
Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.
LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment. LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure. LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law. This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.

EXECUTIVE SUMMARY

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Lead Material Survey at 631 Northland Avenue, Buffalo, New York 14211. The Survey was conducted from January 31 through February 1, 2024.

LEAD MATERIAL SAMPLING

Nine (9) paint chip samples and one (1) stained glass sample were collected and submitted to Paradigm Environmental Services, Inc. for lead analysis. According to the Occupational Safety and Health Administration (OSHA) Lead in Construction Standard, any concentration of lead in paint or other materials above zero (0) is considered to be lead-containing. Per OSHA Standards, nine (9) out of the ten (10) samples were determined to be lead-containing.

1.0 INTRODUCTION

Ravi Engineering & Land Surveying, P.C. (RE&LS) was retained by Wendel to conduct a Limited Lead Material Survey at 631 Northland Avenue, Buffalo, New York 14211. The Survey was conducted from January 31 through February 1, 2024.

2.0 PROJECT OVERVIEW

The Survey was conducted to support the renovation project of 631 Northland Avenue, Buffalo, New York. The scope of work was based on electronic correspondence between RE&LS and Wendel from July 2023 with follow-up correspondence in December 2023. Drawings of the building design from 1953 were provided by Wendel and included a ground floor and roof plan. As well as, detailed designs of the toilet rooms, furnace room, plumbing and the heating and ventilation systems. The Survey included the entire structure with exception of the roof.

3.0 LEAD MATERIAL SAMPLING/FINDINGS

The Lead Material Survey was conducted using portions of Chapter 7 of the United States Department of Housing and Urban Development (USHUD) *Guidelines for the Control and Evaluation of Lead-Based Paint Hazards in Housing (2012).* This Lead Material Survey is not intended to be a: "surface-to-surface investigation for lead-based paint" as defined by USHUD. Paint chip sampling procedures were used in accordance with USHUD. The remainder of the Guideline dictates procedures to be used for residential housing constructed before 1978. According to USHUD and the United States Environmental Protection Agency (USEPA), a paint/material is considered to be lead-based if concentrations are 0.5% or greater, by weight.

Applicable lead paint guidelines for the construction industry can be found in 29 CFR 1926.62. The Occupational Safety and Health Administration (OSHA) Lead in Construction Standard does not mandate testing for paint prior to, or post-renovation or renovation activities. The OSHA Standard is intended to protect workers from occupational exposures to lead in construction. For the purpose of the OSHA Standard, any concentration of lead in paint or other materials above zero (0) is considered to be lead-containing.

Nine (9) paint chip samples and one (1) stained glass sample were collected and submitted to Paradigm Environmental Services, Inc. (Paradigm) for lead analysis. A copy of Paradigm's Certification is included in Attachment D. Bulk sample locations are included in Attachment A. Per OSHA Standards, eight (8) of the nine (9) paint chip samples and the one (1) glass sample were determined to be lead-containing.

Table 1 – LEAD MATERIAL SAMPLING RESULTS

Sample Number	Location	Substrate	Color	Result by weight (%)
Paint-1	Exterior wall	Concrete block	Red	0.0977
Paint-2	Furnace railings and cross beams	Metal	Orange	**0.654**
Paint-3	Toilet room ceiling (Women's)	Plaster	Brown	0.00638
Paint-4	Toilet room ceiling (Men's)	plaster	White	0.266
Paint-5	Toilet room partitions	Metal	Green	0.131
Paint-6	Door to exterior	Metal	Maroon	0.113

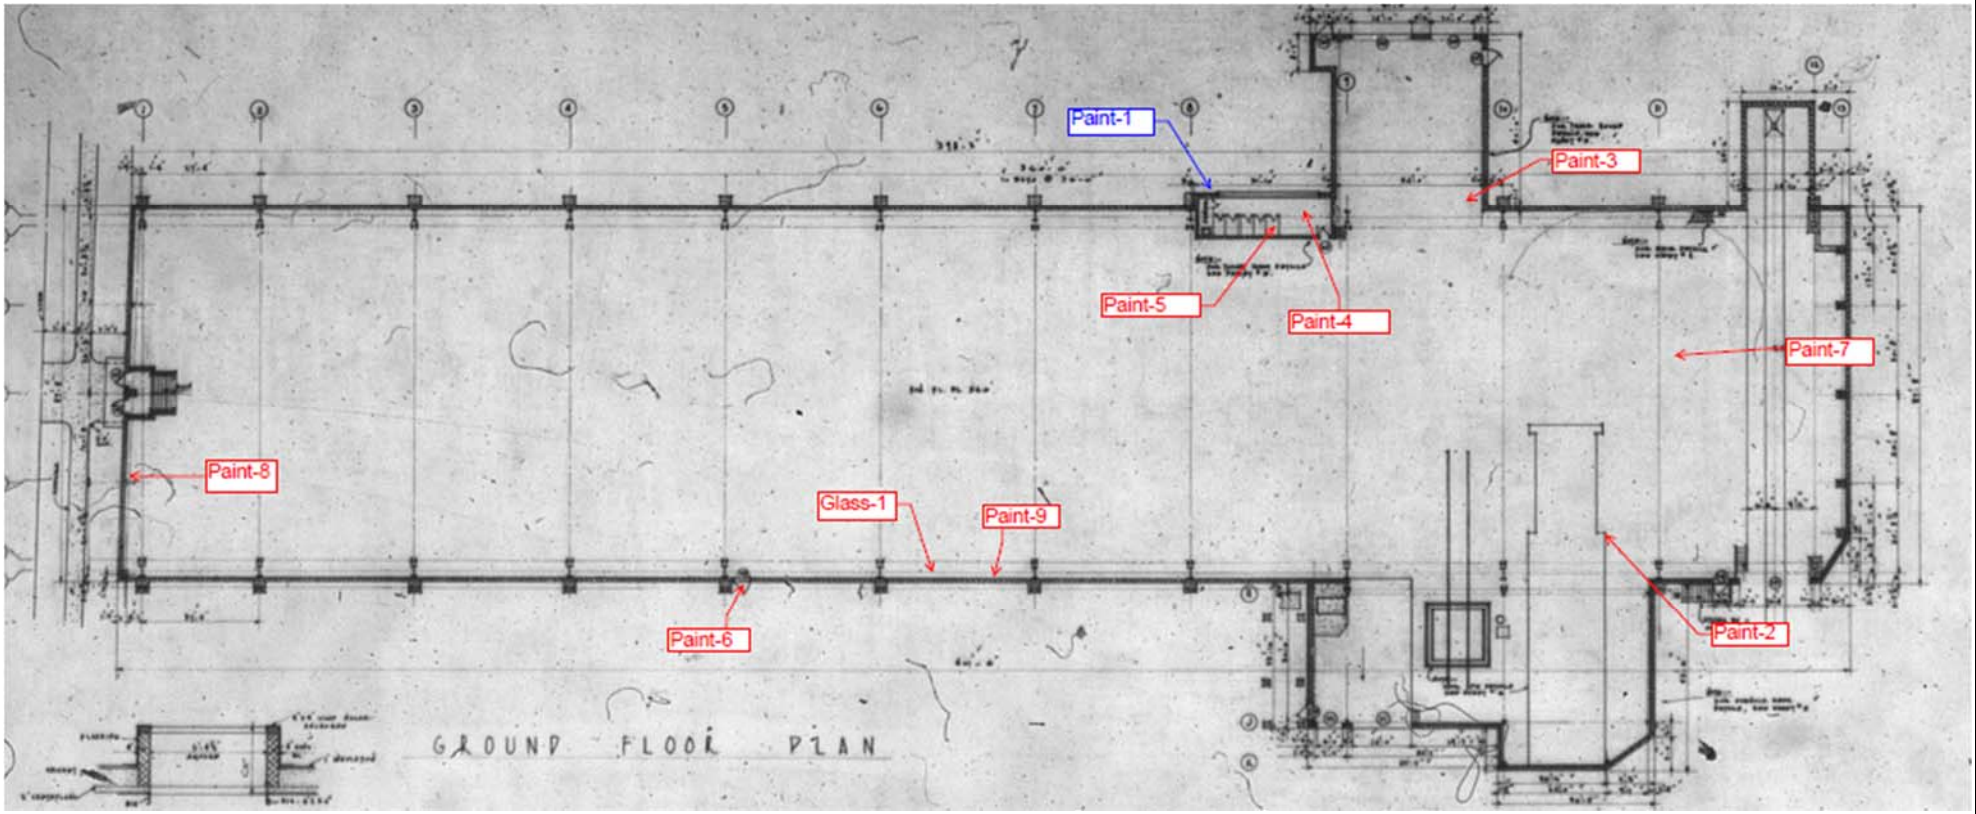
Sample Number	Location	Substrate	Color	Result by weight (%)
Paint-7	Machinery	Metal	Blue	**1.66**
Paint-8	Metal sheets	Metal	Dark gray	BDL
Paint-9	Electrical box	Metal	Red/orange	0.00697
Glass-1	Window	Glass	Blue	**1.36**

BDL: Below Detection Limit
Bold: *Lead based material*

4.0 LIMITATIONS OF INVESTIGATION

The Survey included the spaces outlined in Section 2.0 Project Overview. Areas that were inaccessible were not sampled nor identified.

5.0 RECOMMENDATIONS



Suspect painted materials or other stained glasses, not identified in this Survey report, discovered during renovation or renovation activities shall be assumed to be lead-based until laboratory analysis proves otherwise. Contract work that will disturb lead-containing materials shall be performed in accordance with 29 CFR 1926.62.

Analytical Report Appendix

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.
"E" = Result has been estimated, calibration limit exceeded.
"H" = Denotes a parameter analyzed outside of holding time.
"Z" = See case narrative.
"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.
"J" = Result estimated between the quantitation limit and half the quantitation limit.
"L" = Laboratory Control Sample recovery outside accepted QC limits.
"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.
"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.
"" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.*
"(1)" = Indicates data from primary column used for QC calculation.
"A" = denotes a parameter for which ELAP does not offer approval as part of their laboratory certification program.
"F" = denotes a parameter for which Paradigm does not carry certification, the results for which should therefore only be used where ELAP certification is not required, such as personal exposure assessment.

GENERAL TERMS AND CONDITIONS
LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written, between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, term or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty. Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.
Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices. Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately. Evaluation and reporting of initial screening runs may incur additional fees.

Limitations of Liability. In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to re-perform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.
LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.
All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.
Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure. Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance with applicable laws.

Sample Handling. Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises.
Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.
Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.
LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment. LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure. LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law. This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.

Analytical Report Appendix

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.
"E" = Result has been estimated, calibration limit exceeded.
"Z" = See case narrative.
"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.
"J" = Result estimated between the quantitation limit and half the quantitation limit.
"L" = Laboratory Control Sample recovery outside accepted QC limits.
"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.
"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.
"" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.*
"(1)" = Indicates data from primary column used for QC calculation.

GENERAL TERMS AND CONDITIONS
LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written, between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, tern or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty. Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.
Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices. Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately. Evaluation and reporting of initial screening runs may incur additional fees.

Limitations of Liability. In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to re-perform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.
LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.
All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.
Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure. Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance with applicable laws.

Sample Handling. Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises.
Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.
Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.
LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment. LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure. LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law. This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.

EXECUTIVE SUMMARY

Ravi Engineering & Land Surveying, P.C. (RE&LS) performed this Phase I Environmental Site Assessment (ESA) in general accordance with the scope and limitations of ASTM E1527-21 and the November 1, 2005 United States Environmental Protection Agency (USEPA) regulations for "Conducting All Appropriate Inquiries" (CAAI), for Wendel WD Architecture, Engineering, Surveying & Landscape Architecture, P.C (Wendel) and Buffalo Urban Development Corporation (BUDC). Assignment of this document can be made only with the written permission of RE&LS.

Site Description

The subject site is an approximately 2.63-acre parcel on the south side of Northland Avenue in the City of Buffalo, New York (the "Site"). It is developed with an approximately 40,768 square foot (sq. ft.) building of block and brick construction, built in 1953. It is improved with an approximately 24,000 sq. ft. asphalt parking lot to the east, and an approximately 13,800 sq. ft. concrete paved lot to the west of the Site building. The Site is owned by BUDC.

The Site was reportedly developed in 1953 in association with the Niagara Machine & Tool metal fabricating plant historically located on the eastern adjacent property at 683 Northland Avenue. It operated as a metal fabricating plant under the name Clearing Niagara, and has been vacant since operations ceased in 1992. Notable features of the building includes furnaces for metal fabrication, a sandblaster, several overhead cranes, and a railroad spur. Most of the historic metal fabricating machinery has been removed from the Site building. Historic use of the Site for manufacturing is a recognized environmental conditions (RECs).

The Site inspection (reconnaissance) conducted on February 1, 2024 also identified several RECs in connection with the Site. Several drums, oil staining on the wood block flooring, an apparent manhole with a welded cover, an aboveground storage tank (AST) (contents unknown), at least one floor drain, and a sump were observed in the subject building.

A review of available historic documentation, including Sanborn maps, aerial photographs, and street directories indicates that the Site and adjacent properties were historically utilized for manufacturing of machinery and sheet metal, household and automotive polish, liquid and cement, electric control panels, and/or printed circuit boards.

Phase II ESA; 631, 683, 741, and 777 Northland Avenue (Fisher Associates, September 2015)

RE&LS reviewed Fisher's Phase II ESA conducted in 2015. The results of this Phase II ESA indicate that soil contamination near the south end of the Site building and southeastern portion of the Site exceed NYCRR Part 375-6.8 Commercial and Industrial Use Soil Cleanup Objectives (SCOs) for semi-volatile organic compounds (SVOCs) and metals. Polychlorinated biphenyls (PCBs) were detected in samples collected from the wood block flooring.

Adjacent Properties Descriptions

A review of historical documentation and regulatory databases has identified two adjacent properties of concern.

Vibratech, Inc. Site (formerly Houdaille Industries)

This facility is located on the northern adjacent property at 537 East Delvan Avenue, and was historically used for industrial purposes dating back to 1927. It is identified on the Superfund Enterprise Management System (SEMS), State Hazardous Waste Sites (SHWS), and Vapor Reopened databases. Operations included degreaser use and storage with several 10,000 to 12,000-gallon underground storage tanks (USTs) and ASTs, and an open hole bedrock well that was potentially used for disposal. Contaminants of concern at this property include petroleum products, and chlorinated volatile organic compounds (cVOCs), including trichloroethane (TCE).

Western NY Workforce Training Center

This facility is located on the eastern adjacent property addressed as 665 & 683 Northland Avenue, and is identified on the New York (NY) Brownfields database. The property was historically used as a machine and tool works facility beginning in 1911, and used hydraulic, electrical, and industrial equipment that led to the contamination of the property. The contamination included SVOCs, PCBs, and metals in soil, and TCE in soil vapor. Hydraulic oil was also identified in the bedrock.

Remedial actions have successfully achieved SCOs for Commercial use. However, residual contamination remains in soil, bedrock, and soil vapor. The property is being managed under a Site Management Plan (SMP). As the use of the property is restricted by the SMP, the residual contamination is considered a controlled recognized environmental condition (CREC) as defined in Section 1.1 of this report. Soil, groundwater and soil vapor at the Site have the potential to be adversely impacted from historic operations at this property.

Business Environmental Risks

RE&LS conducted a Hazardous Materials Inspection of the Site building to identify the presence of asbestos containing materials (ACM), lead-based paint (LBP), and materials containing PCBs. The findings of the Hazardous Materials Survey will be submitted under separate cover.

Conclusion

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice El527-21 of the subject property at 631 Northland Avenue in the City of Buffalo, New York. Any exceptions to, or deletions from, this practice are described in Section 11 of this report. This assessment has revealed no RECs, CRECs, or significant data gaps in connection with the Site **except for the following:**

1. Historic usage of the Site for metal fabricating, and the potential for releases of cutting oils, hydraulic oils, other petroleum products, and degreasing agents
2. Analytical data from a 2015 Phase II ESA investigation identifying hazardous concentrations of SVOCs in soil
3. Floor drains, a sump, and an apparent manhole with a welded cover in the Site building, and the potential for improper disposal of degreasers and other contaminants
4. A railroad spur on the Site, and the potential for petroleum and chemical spills during the transfer of shipments

5. The potential for petroleum releases in association with the AST, and the potential for unidentified orphan USTs to be present on the Site
6. The potential for groundwater and soil vapor impacts at the Site from historic industrial uses of the adjacent properties, specifically in association with the CREC on the eastern adjacent property and the former Houdaille Industries property on the northern adjacent property.

Additional Investigation and Recommendations

Based on this Phase I ESA, additional investigation is warranted. We recommend performing a Phase II ESA/Site Characterization Investigation to evaluate the extent of contamination identified in Fisher's Phase II ESA, and the presence of unidentified contamination at the Site.

1.0 INTRODUCTION

1.1 Purpose

The purpose of the Phase I ESA is to perform an "All Appropriate Inquiry" (AAI) into the previous ownership and uses of the property as defined in Title 42 of the United States Code (USC), Section 9601(35)(B).

The Phase I ESA is performed to characterize the Site with respect to RECs in connection with the property, including the range of contaminants within the scope of Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and petroleum products.

A Recognized Environmental Condition (REC) is defined by ASTM E1527-21 as the presence or likely presence of *hazardous substances* or *petroleum products* on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any *hazardous substances* or *petroleum products* into structures on the property or into the ground, groundwater, or surface water of the property, even under conditions that are in compliance with the laws.

A Historical Recognized Environmental Condition (HREC) is defined by ASTM E1527-21 as *A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been address to the satisfaction of the applicable regulatory authority or meeting unrestricted residential use criteria established by a regulatory authority without subjecting the property to any required controls (e.g. property use restriction, AULS, institutional controls, or engineering controls), at the time the Phase I ESA is conducted (e.g. if there has been a change in the regulatory criteria).*

A Controlled Recognized Environmental Condition (CREC) is defined by ASTM E1527-21 as *A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).*

The term REC is not intended to include de minimis conditions that generally do not present a threat to public health or the environment, and that would not be the subject of an enforcement action if brought to the attention of the appropriate regulatory agencies.

1.2 Scope of Services

The scope of the Phase I ESA is limited to a review of the following sources of information.

A) A review of permits, reports, and other records to identify:
- past and on-going releases of possible environmental contaminants (i.e., hazardous and non-hazardous materials);
- proximity to sensitive receptors;
- past and current aboveground storage tanks (ASTs) and underground storage tanks (USTs) including location, size, age, construction material and contents;
- hazardous materials/hazardous waste management, storage and disposal practices;
- industrial wastewater discharge practices;
- elevated radon levels of potential concern; and
- other information as required by ASTM E1527-21 and EPA 40 CFR Part 312.

B) Historic Sanborn Maps, aerial photographs, and street directories which may reflect prior uses of the subject property and which are reasonably obtainable through state or local government agencies.

C) Reasonably obtainable federal, state, and local government records of: listed hazardous/solid waste sites, spill reports, underground and bulk storage tank facilities, hazardous waste treatment, storage and disposal (TSD) handler and generator records and recorded environmental complaints as provided by Environmental Data Resources, Inc. (EDR).

D) A visual Site reconnaissance of the subject property and all facilities and improvements on the subject property. The Site reconnaissance will include a visual inspection, interviews of the owner, knowledgeable personnel, and such other persons as required by ASTM E1527-21 and EPA 40 CFR Part 312.

E) To augment that information, Freedom of Information Law (FOIL) requests were sent to the New York State Department of Environmental Conservation (NYSDEC), Erie County, and the City of Buffalo for information relative to the Site.

1.3 Significant Assumptions

This report is prepared with no significant assumptions. RE&LS reserves the right to revise this report based upon any pertinent information concerning the subject property that may be forthcoming from these agencies.

1.4 Limitations and Exceptions

Wendel WD Architecture, Engineering, Surveying & Landscape Architecture, P.C **(**Wendel) retained RE&LS to perform this work per the Notice to Proceed dated January 26, 2024.

RE&LS represents only that it provides services in accordance with generally accepted practices. No other representation, expressed or implied, is included or intended as part of its services, proposals, contracts or reports.

RE&LS cannot provide guarantees, certifications or warranties that the property is or is not free of environmental impairment without a Phase II Environmental Site Assessments investigation involving collection and laboratory analysis of environmental samples. Even with such a program, the data and samples from any given soil boring or monitoring well will indicate conditions that apply only at that particular location, and such conditions may not necessarily apply to the general Site as a whole.

1.5 Special Terms and Conditions

RE&LS has performed this work in general accordance with the ASTM E1527-21 Standard Practice for ESAs, the November 1, 2005 USEPA regulations for CAAI.

1.6 User Reliance

This report is prepared exclusively for Wendel and BUDC. This report is not for the use of, nor may it be relied upon by any other person or entity, for any purpose without the advance written consent of RE&LS.

2.0 SITE DESCRIPTION

2.1 Location and Legal Description

The Site is developed with a vacant warehouse on an approximately 2.63-acre parcel on the south side of Northland Avenue in the City of Buffalo, New York. It is owned by BUDC, and is currently used for storage of construction building materials.

The Site is listed as City of Buffalo tax identification number 101.21-5-1.21.

RE&LS was not provided with a legal description of the subject Site when this Phase I ESA was prepared.

2.2 Site and Vicinity General Characteristics

The Site is developed with a vacant warehouse that was historically used as a metal fabrication facility. It is surrounded by a mix of industrial, commercial, and residential properties.

2.3 Descriptions of Structures, Roads, Other Improvements on the Site

The Site is developed with an approximately 40,768 sq. ft. building of block and brick construction, built in 1953. It is improved with an approximately 24,000 sq. ft. asphalt parking lot to the east, and an approximately 13,800 sq. ft. concrete paved lot to the west of the subject building. A CSX railroad corridor bounds the Site to the south.

2.4 Geologic, hydro geologic, hydrologic and topographic conditions of the property; and of the surrounding area

Bedrock beneath the Site is composed of a Middle Devonian stratified sequence. Surficial deposits are mapped as "urban land." Based on surficial topography, the regional groundwater flow direction beneath the Site is presumed to be towards Lake Erie to the southwest.

2.5 Current and Historic Uses of the Site

The Site was reportedly developed in 1953 in association with the Niagara Machine & Tool metal fabricating plant historically located on the eastern adjacent property at 683 Northland Avenue. It was operated under the name Clearing Niagara until approximately 1992, and is currently vacant.

2.6 Current Uses of the Adjacent Properties

Uses of the adjacent properties includes the following:

North:	Parking lot
Northeast	Vacant lot/power transfer station
East	Northland Central complex including ReTech Systems, Northland Workforce Training Center, Buffalo Manufacturing Works, Rodriguez Construction Group, Alfred State College, Insyte Consulting, Garwood Medical Devices, Bank on Buffalo, SUNY Erie, NY Power Authority, and SparkCharge (683 Northland Avenue)
South	CSX, Inc. railroad corridor
West	Vacant commercial building (597 Northland Avenue)
Northwest	Vacant manufacturing building (612 Northland Avenue)

3.0 USER PROVIDED INFORMATION

A User Questionnaire was completed by BUDC Representative, Angelo Rhodes II. The completed questionnaire is included in Appendix 3.

3.1 Title Records

RE&LS reviewed Stewart Title Insurance Company Policy No. O-8911-000680022 for 644, 664, 631, 688, 690, 698 and 741 Northland Avenue, and 126 and 128 Dutton Street in the City of Buffalo, New York. Based on our review of the title report, no environmental liens or activity and use limitations, per Section 6.2 of ASTM E1527-21, were identified as being recorded against the Site.

3.2 Environmental Liens or Activity and Use Limitations

Mr. Rhodes stated that there are no liens or activity and use limitations due to environmental conditions relative to the Site (Appendix 3).

3.3 Specialized Knowledge

Mr. Rhodes stated that the Site was historically used as a machine and tool works facility.

3.4 Valuation Reduction for Environmental Issues

Mr. Rhodes stated that the Site was purchased by BUDC as is.

3.5 Commonly Known or Reasonably Ascertainable Information

Mr. Rhodes referred to a previous Phase I and II ESAs completed by Fisher Associates in 2015 (refer to Section 5.8.5).

3.6 Degree of Obviousness of the Presence of Contamination

Mr. Rhodes stated that the potential for contamination exists due to the Site's relationship with the other properties located nearby where contamination was previously identified.

3.7 Reason for Performing Phase I Environmental Site Assessment

This Phase I ESA was performed to update a Phase I ESA performed in 2015.

4.0 SITE RECONNAISSANCE

Lynn Zicari and Whitney McAlpin of RE&LS conducted the Site reconnaissance on February 1, 2024 to identify potential RECs associated with the subject property.

4.1 Methodology and Limiting Conditions

The Site reconnaissance was performed by conducting a Site walkover of the building exterior and perimeter, and a walk-through of the Site building interior. An assessment of structural conditions and hazardous materials was conducted under a separate scope of work.

All areas within the Site building were accessed during the Site reconnaissance; however, snow cover on the eastern and southern parking lots, and storage of building materials within the subject building limited observations of floor and ground surfaces. In addition, RE&LS was not able to enter a blast furnace on the west side of the building exterior; a hatch opening allowed a limited visual inspection that indicated that the furnace was empty.

RE&LS was limited to the degree of accuracy of information provided by the EDR database report, readily available historic information, and information obtained by Site contacts and local and state agencies.

4.2 Observations

4.2.1 Source of potable water on the property

The Site is serviced by municipal water.

4.2.2 Sewage disposal system on the property (type and age)

The Site is serviced by the municipal sewer system.

4.2.3 Any wastewater (including stormwater) discharges into a drain, ditch or stream on the property and on adjacent property

Storm drains were observed on the northern portion of the Site and in the parking lot on the eastern portion of the Site. They reportedly discharge to the public sewer system.

4.2.4 Sources of any noxious odors, any pools of liquid, or any standing surface water on the subject property or adjacent properties

At the time of the Site inspection, petroleum odors were observed throughout the Site building.

4.2.5 All drains and any pits, cisterns, cesspools or similar receptacles where liquids drain, collect or are stored (e.g., sumps) on the subject property or adjacent properties

A floor drain, a large sump and floor pit with standing water, and an apparent manhole with a welded cover were observed in the Site building. The floor drain and sump reportedly discharge to the public sewer system. No information regarding the construction or discharge location of the manhole structure could be obtained.

4.2.6 Pits, ponds and lagoons (open pools) likely to contain hazardous substance or petroleum products, particularly if used in connection with waste disposal or waste treatment on the subject property and on adjacent properties)

A sand pit located in the northwestern corner of the Site building was observed covered by pallets of building materials, therefore no observations could be made regarding the appearance of the contents of the pit.

4.2.7 Current and past uses likely to indicate or known to have resulted in RECs on the property or adjacent properties

The Site is developed with a large industrial building that features furnaces for metal fabrication, a sandblaster, several overhead cranes, and a railroad spur. Several drums were also observed in the building.

The northern and eastern adjacent properties currently are utilized as parking lots. A large chimney stack was observed on the northern adjacent property addressed as 537 Delvan Avenue, and appears to be all that is left of the historical industrial building on that property. The western and northwestern adjacent properties are developed with vacant industrial buildings.

4.2.8 Current and past uses of the subject property and adjacent properties involving petroleum products and/or hazardous materials

With the exception of the overhead cranes, most of the historic metal fabricating machinery has been removed from the Site building. Oil staining from cutting oils and leaky machinery was observed on the wood block flooring. An AST (contents unknown) was noted at the western perimeter of the building exterior.

4.2.9 All ASTs and USTs, including contents, capacity and age. Identify visible vent pipes; fill pipes, and access ways

An AST was noted on the western exterior of the Site building. No ASTs or USTs were noted on any of the adjacent properties at the time of the Site inspection. However, regulatory records include an AST and USTs historically located on the eastern adjacent property (refer to Section 5.2).

4.2.10 Contents of any drums and other containers on the subject property or adjacent properties

Several 55-gallon drums were found throughout the subject property. Five drums inside the Site building contained a material that appeared to be soil. One of the drums was labeled “Boiler Water Treatment”.

4.2.11 Any dry wells, irrigation wells, injection wells, abandoned wells, monitoring wells, supply wells, or other wells

Three groundwater monitoring wells were observed in the parking lot on the eastern and southeastern portions of the Site. One of the wells was installed in conjunction with a Phase II ESA performed in 2015 by Fisher Associates (refer to Section 5.8.5). No information was obtained for the other two wells as of the date of this report.

4.2.12 Electrical or hydraulic equipment likely to contain polychlorinated biphenyls (PCBs)

Historical use of the Site as a metal-fabricating facility, and the presence of cranes within the building indicate usage of cutting, lubricating and hydraulic oils, and the potential for leaks and spills. Based on the construction date of the Site building, and the 1979 ban on the production of PCB-containing products in the United States, these oils potentially contained PCBs.

A pad-mounted transformer was observed in the parking lot adjacent to the Northland Avenue right-of-way. No leaks, stains, or spills were observed in the vicinity of the transformer. However, the transformer oil may also contain PCBs. The transformer is owned by Niagara Mohawk Power Corporation. As the owner of the transformer, it is responsible for the proper operation, maintenance, repair and disposal of the transformer and its contents. If a spill occurs, it is responsible for remediation of the spill.

4.2.13 Stained soil or pavement

None observed

4.2.14 Stressed vegetation

None observed

4.2.15 Any solid waste disposal on Site

Miscellaneous solid waste including oil-covered wood block flooring, fire brick, construction and demolition debris, and miscellaneous solid waste was observed on the interior and exterior of the Site.

4.2.16 Any unnatural grading or fill of unknown origin

None observed

4.2.17 The type of heating, ventilation, and air conditioning (HVAC) system and fuel source

The Site building is not currently heated. It was reportedly historically heated with steam generated from boilers located at 683 Northland Avenue.

4.2.18 Any stains or corrosion on floors, walls or ceilings

The floor in the Site building is constructed of wood blocks overlying concrete. The wood blocks appeared to be stained from cutting oils, hydraulic oils, and/or other petroleum products.

5.0 RECORDS REVIEW

RE&LS obtained the EDR Radius Map Report dated January 30, 2024 using the ASTM-specified search distances relative to the Site (Appendix 5).

5.1 Federal Government Records

National Priorities List (NPL)

There are no NPL facilities identified within 1.0 mile of the Site.

Delisted NPL

There are no Delisted NPL facilities identified within 1.0 mile of the Site.

Superfund Enterprise Management System (SEMS)

There are two (2) SEMS facilities identified within 0.5 mile of the Site. One of these facilities is identified as *Vibratech* at 537 East Delvan Avenue, located on the northern adjacent property. Based on distance and elevation, as well as the historical use of this facility for manufacturing, this facility is of potential concern relative to the Site.

SEMS-Archive

There is one (1) SEMS-Archive facility identified within 0.5 mile of the Site. An archived facility is one at which USEPA has determined that assessment has been completed and no further remedial action is planned. It does not appear to be of environmental concern relative to the Site.

Corrective Actions (CORRACTS)

There is one (1) CORRACTS facility identified within 1.0 mile of the Site. Based on the distance from the Site, it is not likely that this facility will have an adverse environmental impact on the Site.

Resource Conservation and Recovery Act Information System–Transporters, Storage and Disposal Facilities (RCRA - TSDF)

There are no RCRA-TSDF identified within 0.5 mile of the Site.

RCRA –Large Quantity Generator (LQG), Small Quantity Generator (SQG), Very Small Quantity Generator (VSQG), and Non-Generators (Non-Gen)

There are no RCRA-listed LQG, SQG, or VSQG facilities identified on the Site or the adjacent properties.

There are three (3) RCRA-listed Non-Gen facilities identified on the eastern and northwestern adjacent properties. These facilities are required to provide information concerning their activities to state environmental agencies, which in turn provide the information to regional and national USEPA offices. These facilities are not identified on the EPA corrective action list, or NYSDEC spills list. It is not expected that activities at these facilities will have an adverse environmental impact upon the Site.

Federal Institutional Control/Engineering Control (IC/EC) Sites

The Site is not identified on the IC/EC database.

Emergency Response Notification System (ERNS)

The Site is not identified on the ERNS database.

5.2 State Government Records

State Hazardous Waste Sites (SHWS)

There are seven SHWS within 1.0 mile of the Site. A review of the location and distance of these SHWS indicates that one facility, *Vibratech, Inc*. (formerly *Houdaille Industries*), located at 537 East Delavan Street, has the potential to negatively impact groundwater and indoor air at the Site. *Vibratech, Inc*. is located on the northern adjacent property, and was historically used for industrial purposes dating back to 1927. Operations included degreaser use and storage with several 10,000 gallon or greater USTs and ASTs, and an open hole bedrock well that was potentially used for disposal. Contaminants of concern at this facility include petroleum products, and TCE and other cVOCs.

Solid Waste Facilities/Landfills (SWF/LF)

A search of SWF/LF within 0.5 mile identified three (3) facilities that are >0.2 mile the Site. Based on distance and the apparent groundwater flow direction, it is not likely that either of these facilities will have an adverse environmental impact on the Site.

Leaking Storage Tanks (LTANKS)

There are twenty-two (22) LTANK within 0.5 mile of the Site. Based on distance and/or the apparent groundwater flow direction, it is not likely that any of them will have an adverse environmental impact on the Site.

Registered Petroleum Bulk Storage (PBS) including Aboveground Storage Tanks (AST) and Underground Storage Tanks (UST)

Western NY Workforce Training Center, located at the eastern adjacent property addressed as 683 Northland Avenue, is identified in the PBS database. The listing includes one (1) closed-removed 6,000 gallon AST, and nine (9) closed-removed USTs ranging between 1,000 and 23,380 gallons. Based on the closed-removed status of the tanks, and the lack of NYDEC spills associated with the property, it is not likely that these tanks will have an adverse environmental impact on the Site.

State Institutional Control/Engineering Control (IC/EC)

The Site is not identified on the NYS IC/EC registry.

Voluntary Cleanup Program (VCP)

There are no VCP facilities within 0.5 mile of the Site.

NY Brownfields

There are four (4) NY Brownfields within 0.5 mile of the Site. One (1) facility, *Western NY Workforce Training Center*, is located on the eastern adjacent property addressed as 665 & 683 Northland Avenue. The property was historically used as a machine and tool works facility beginning in 1911, and used hydraulic, electrical, and industrial equipment that led to the contamination of the property. The contamination included SVOCs, PCBs, and metals in the soil, and TCE in soil vapor. Hydraulic oil was also identified in bedrock.

Remedial actions have successfully achieved SCOs for Commercial use. However, residual contamination remains in soil, bedrock, and soil vapor, and the property is being managed under a SMP. As the use of the property is restricted by the SMP, the residual contamination is considered a CREC as defined in Section 1.1 of this report. Soil, groundwater and soil vapor at the Site have the potential to be adversely impacted from historic operations at this property.

Environmental Restoration Program (ERP)

There is one (1) ERP facility identified within 0.5 mile of the Site. Based on distance and elevation, it is not likely that this property will have an adverse environmental impact on the Site.

5.3 Additional Environmental Record Sources

US Brownfields

There is one (1) US Brownfield within 0.5 mile of the Site. Based on distance and elevation, it is not likely that this property will have an adverse environmental impact on the Site.

SW Tire

There is one (1) SW Tire facility within 0.5 mile of the Site. Based on distance, it is not likely that this property will have an adverse environmental impact on the Site.

NYSDEC Spills

There are five (5) NYSDEC Spills within 0.125 mile of the Site. All have been closed by the NYSDEC with no further action required. Two (2) of the spills occurred on adjacent properties:

- Spill No. 1402816 was reported at 601 Northland Avenue, the western adjacent property, after approximately twelve (12) 55-gallon burnt and bulging drums were observed in the location of a former commercial building. The drums were found to be empty or containing water. They were removed from the property, and the spill was closed by the NYSDEC with no further action required.
- Spill No. 9601211 was reported at 602 Northland Avenue, the northwestern adjacent property, after it was reported that a hose from a powder coating line was discharging to a catch basin. The property was inspected, and the hose was found under the sewer grate. No additional information was available. The spill was closed by the NYSDEC.

Based on the information provided, it is not likely that these spills will have an adverse environmental impact on the Site.

Formerly Used Defense Sites (FUDS)

There are three (3) FUDS within 0.5 mile of the Site. Based on distance, it is not likely that these facilities will have an adverse environmental impact on the Site.

Formerly Utilized Sites Remedial Action Program (FUSRAP)

There is one (1) FUSRAP facility identified within 0.5 mile of the Site. Based on distance and elevation, it is not likely that this property will have an adverse environmental impact on the Site.

PFAS (Per- and Polyfluoroalkyl Substances) ECHO (Enforcement and Compliance History Online)

Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. The United States Environmental Protection Agency (EPA) has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

According to EDR, there are two (2) PFAS ECHO facilities within 0.5 mile of the Site. One (1) of these facilities is located at 711 Northland Avenue, approximately 0.14 mile east of the Site.

NYS CERCLIS Equivalent Sites (HSWDS)

There is one (1) HSWDS within 0.5 mile of the Site. Based on the distance from the Site, it is not likely that this property will have an adverse environmental impact on the Site.

NY Manifest/Manifest

There are sixteen (16) NY Manifest facilities within 0.5 mile of the Site. Three Manifest listings are associated with the Site and/or adjacent properties, and are included here to document historic use of contaminants that could potentially impact the Site:

Clearing Niagara, addressed as 637-697 Northland Avenue, is listed in the Manifest database as EPA ID NYD002101442. EDR identifies this as the Site. However, according to the City of Buffalo Assessor, the Site has been addressed as 631 Northland Avenue since it was first developed. Operations reportedly ceased at the Site in 1992, and several of the Manifest documents are dated after 1992. This listing appears to be associated with the eastern adjacent property. The following materials were reportedly generated:

- 1989: 217 pounds of ignitable wastes
- 1991: 172 pounds of ignitable wastes, and 172 pounds tetrachloroethylene
- 1992: 172 pounds of ignitable wastes
- 1993: 31 gallons of ignitable wastes
- 1995: 840 pounds of spent halogenated wastes including xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n-butyl alcohol, cyclohexane, and methanol
- 1998: 1,050 pounds spent halogenated wastes
- 2001: 5,000 pounds and 110 gallons of ignitable wastes, and 12,500 pounds of spent halogenated

683 Northland Avenue, is located on the eastern adjacent property. This property, identified as EPA ID NYR000232587, generated 35,776 kilograms of PCB wastes including contaminated soil, solids, sludges, clothing, rags and dredge material in 2017 that was transported off-site to a landfill for disposal.

Buffalo Powder Coating, addressed as Northland Avenue, is located on the northwestern adjacent property. This property, identified as EPA ID NYR0000563684, generated 4,800 pounds of cadmium between 1994 and 1995 that was transported off-site to a landfill for disposal.

PA Manifest

There are two (2) PA Manifest facilities within 0.5 mile of the Site. Based on the distance from the Site, is not likely that these facilities will have an adverse environmental impact on the Site.

Vapor Reopened

There is one (1) Vapor Reopened facility located on the northern adjacent property, addressed as 537 East Delavan Avenue. Based on the proximity of this property to the Site, there is the potential that soil vapor beneath the Site has been adversely impacted from historic use of this property.

5.5 Orphan Sites

The following orphan sites were identified by EDR:

- 664-690 Northland Avenue is identified on the NY SHWS, and is located at 664, 688 and 690 Northland Avenue, approximately 160 feet to the northeast of the Site.
- OTIS Elevator is identified on the NY SHWS, and is located at Grider Street, at least 0.3 mile to the east of the Site.
- NYS Thruway Exit 52 is identified on the NY SHWS, and is located at Exit 52 (Walden Avenue) Interchange, approximately 3.5 miles to the southeast of the Site.
- CMS Associates, Inc. is identified on the NY Vapor Reopened, and is located at 210 French Road, approximately 5.7 miles to the southeast of the Site.

Based on the distance from the Site, the orphan site addressed as 664-690 Northland Avenue is of potential environmental concern relative to the Site.

5.7 Physical Setting Source(s)

EDR references the current USGS 7.5 Minute Topographic Map (Appendix 5). Based on the surficial topography, the regional groundwater flow direction beneath the Site is presumed to be toward Lake Erie to the southwest. Bedrock beneath the Site is composed of a Middle Devonian stratified sequence, and surficial deposits are mapped as urban land.

5.8 Historic Use Information on the Site and the Adjacent Properties

5.8.1 Sanborn Maps

Year	Site Description	Adjacent Property Description
1900	Unmapped	North – Unmapped Northeast - Unmapped East – Unmapped South – Railroad tracks West – C.H. Hosmer & Co. (grease, oil & bicycle sundries manufacturing) Northwest - Unmapped
1917	Undeveloped	North – Undeveloped Northeast – Residential dwellings East – Niagara Machine & Tool Works (sheet metal work machinery manufacturing) South – Railroad tracks West – Geo. A. Hosmer & The Buffalo Specialty (grease, oil & bicycle sundries manufacturing) Northwest – Residential dwelling
1939	Undeveloped	North – Boiler house with a fuel oil tank approximately 300 feet from the Site Northeast – Residential dwellings East – Niagara Machine & Tool Works (sheet metal work machinery manufacturing) South – Railroad tracks West – Liquid Veneer Corporation (household & automotive polish, liquid and cement manufacturing) Northwest – Heat treating building
1950	Undeveloped	North – Boiler house and pump house with a fuel oil tank and four 12,000-gallon oil tanks approximately 300 feet from the Site Northeast – Residential dwellings East – Niagara Machine & Tool Works (sheet metal work machinery manufacturing) South – Railroad tracks West – Houde Engineering Corporation Northwest – Heat treating building
1986	Developed with the current Site building, and labeled as a "factory building"	North – Boiler house and pump house with a fuel oil tank and four 12,000-gallon oil tanks approximately 300 feet from the Site Northeast – Switch house and transfer yard East – Niagara Machine & Tool Works (sheet metal work machinery manufacturing) South – Railroad tracks West – Houde Engineering Corporation Northwest – Heat treating building

5.8.2 Aerial Photographs

Year	Site Description	Adjacent Property Description
1938 1951	Undeveloped	North – Large manufacturing type building and parking lot Northeast – Residential homes East – Large manufacturing type building complex South – Railroad tracks West – Manufacturing type building Northwest – Manufacturing type building
1958 1966	Developed with the current Site building	North – Large manufacturing type building and parking lot Northeast – Residential homes East – Large manufacturing type building complex South – Railroad tracks West – Manufacturing type building Northwest – Manufacturing type building
1970 1978 1983 1985 1995 2008 2011 2015	Developed with the current Site building	North – Large manufacturing type building and parking lot Northeast – Small building East – Large manufacturing type building complex South – Railroad tracks West – Manufacturing type building Northwest – Manufacturing type building
2019	Developed with the current Site building	North – Parking lot Northeast – Small building East – Large manufacturing type building complex South – Railroad tracks West – Manufacturing type building Northwest – Manufacturing type building

5.8.3 Street Directories

Street directories indicate that the Site was occupied by the following:

Year	Address	Occupant
1925-1992	637 and 643 Northland Avenue	Niagara Machine & Tool Works (Metal Fabricating Plant)

The adjacent properties were used for residential, commercial, and industrial purposes from 1925 until 2013, and included the following occupants of concern:

Northern adjacent property

Year	Address	Occupant
1975-1992	684 Northland Avenue	Niagara Machine & Tool Works parking lot

Eastern adjacent property

Year	Address	Occupant
1930-2001	681 Northland Avenue	Niagara Machine & Tool Works parking lot
1930-2001	683 Northland Avenue	Niagara Machine & Tool Works
2001		Clearing Niagara
2008-2013		Sweeney Steel Service Corporation
1964-1992	685 Northland Avenue	Niagara Machine & Tool Works parking lot
1950-1964	697 Northland Avenue	Niagara Machine & Tool Works

Western adjacent property

Year	Address	Occupant
1964	597 Northland Avenue	Sevens Frederick - division of Udylite Corporation
1970		Stevens Durez - division of Hooker Chemical Foundry Materials
1930-1940	601 Northland Avenue	Liquid Veneer Corporation (factory)
1946-1955		Houde Engineering Corporation (warehouse)
1960		Houdaille Industries Inc. (warehouse)
1980-1985		Neu-Lec Controls Inc. (maker of electric control panels)
1992-2001		Service Manufacturing Group Incorporated (tri-electric printed circuit boards/sheet metal work)

Northwest adjacent property

Year	Address	Occupant
1935-1955	608 Northland Avenue	Houdi Engineering Corporation

5.8.4 FOIL Responses

FOIL requests were sent to the NYSDEC, Erie County, and the City of Buffalo for information relative to the Site; however, no responses have been received as of the date of this report submission.

FOIL requests are provided in Appendix 6.

5.8.5 Other Historic Sources

Phase I ESA; Northland Avenue Properties, 631, 683, 741, and 777 Northland Avenue (Fisher Associates, October 2014, Revised January 2015)

RE&LS reviewed a Phase I ESA prepared by Fisher in 2014 for the Empire State Development Corporation. Fisher's Phase I ESA was conducted for the Site and three adjacent parcels, addressed as 683, 741 and 777 Northland Avenue. 683 Northland Avenue is referred to as the eastern adjacent property in this report. The report was prepared to evaluate whether current or historical activities on or near the subject property may have resulted in significant impacts by hazardous substances or petroleum products.

In their Phase I ESA, Fisher stated that the Site was formerly used as a machine and tool works facility. They observed an approximately 1,000-gallon AST on the western exterior of the Site building, and additional tanks were suspected to be present. Petroleum-based products and hazardous materials were observed on Site at the time of the reconnaissance.

Several RECs were identified in connection with the Northland Avenue Properties.

- There was potential for at least three (3) USTs of unknown size and contents to be present at the Site.
- One (1) approximately 1,000-gallon AST was observed on the western exterior of the Site building.
- Numerous 55-gallon drums containing xylene, antifreeze, hydraulic oil, motor oil, used oil and other contents were observed.
- The floors in the Site buildings are constructed of wooden block overlying concrete. The wooden blocks are stained from cutting oils, hydraulic oils, grease, and other possible petroleum products.
- Multiple piles of debris inside and outside of the Site building
- A Phase II ESA completed by Leader Professional Services, Inc. (Leader) in 2005 for the northeastern adjacent property, addressed as 644 Northland Avenue, and the eastern adjacent property, addressed as 683 Northland Avenue indicated that exceedances of NYSDEC SCOs from on-site sources were detected in subsurface samples and pit water samples.

Based on their findings, Fisher recommended performing a Phase II ESA to determine the extent of the contamination present at these properties.

Phase II ESA; 631, 683, 741, and 777 Northland Avenue (Fisher Associates, September 2015)

The Phase II ESA was performed in May and June 2015 to address the RECs discussed above. Soil samples were collected across the four parcels, including 631 Northland Avenue. Samples of surface liquids and solids were collected from wood block flooring, the sand pit, the furnace pit, and the sump within the 631 Northland Avenue building. A groundwater sample was collected from a monitoring well (MW-1) installed at the southeastern corner of 631 Northland Avenue.

The results of the Phase II ESA indicate detections of metals and PCBs within the wood block flooring and sand pit. Soil borings near the south end of the Site building and southeastern portion of the Site had detections of SVOCs and metals in exceedance of the NYCRR Part 375-6 Commercial and Industrial Use SCOs.

Groundwater limitations for TCE and other cVOCs were exceeded in samples collected from monitor wells installed on the eastern adjacent properties; however, these analytes were not detected in on-site monitoring well, MW-1.

5.8.6 Data Failure

FOIL responses from the NYSDEC, Erie County, and the City of Buffalo have not been received as of the date of this report. However, RE&LS does not consider this to be significant due to the historic use information obtained from the available historical documentation and from Fisher's Phase I and Phase II ESAs. It is not likely that additional information that may be forthcoming from these agencies would change the conclusions or opinions of this report.

The lack of FOIL responses is not considered to be a significant data gap. RE&LS reserves the right to revise this report based upon any pertinent information concerning the subject property that may be forthcoming from these agencies.

6.0 INTERVIEWS

6.1 Interview with Angelo Rhodes, BUDC Representative

According to Mr. Rhodes, the Site building was constructed in 1953 in association with the Niagara Machine & Tool metal fabricating plant located on the eastern adjacent property at 683 Northland Avenue, and was operated under the name Clearing Niagara. BUDC purchased the Site in 2014. He has no knowledge of any environmental liens or activity and use limitations at the Site. He had no information regarding the contents of the AST, the floor drain and sump discharge locations, or the contents of the abandoned drums inside the Site building.

6.2 Interview with Property Manager/Broker, Tom Mancuso

According to Mr. Mancuso, the Site has been vacant since the metal fabricating operations ceased in 1992. He stated that the Site building was heated with steam generated from boilers located at 683 Northland Avenue. He had no information regarding the contents of the AST, floor drain and sump discharge locations, or the contents of the abandoned drums inside the Site building.

6.3 Interviews with Occupants

N/A

6.4 Interviews with Local Government Officials

RE&LS interviewed the City of Buffalo Chief Plumbing Inspector, Keith Ogden, regarding the floor drains and catch basins on the Site. He stated that, based on the age of the building, floor drains, sumps and catch basins discharge to the public sewer system.

6.5 Interviews with Others

None

7.0 BUSINESS ENVIRONMENTAL RISKS (BER)

A Business Environmental Risk (BER) is defined by ASTM E1527-21 as *A risk which can have a material environmental or environmentally-driven impact on the business associated with the current planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated in this practice.*

ASTM E1527-21 states that the following BERs are "non-scope considerations that persons may want to assess in connection with commercial real estate." This list of non-scope considerations is not intended to be all-inclusive.

7.1 Radon

Radon, a naturally occurring, odorless, colorless, radioactive gas, is found throughout the country. Prolonged exposure to elevated indoor radon levels has been associated with increased risks of lung cancer.

NYSDOH conducted a basement radon survey across New York State. According to the results provided in the EDR Radius Map Report, an average level of 1.18 picocuries per liter of radon (pCi/L) was measured in the City of Buffalo. The USEPA has determined an annual average exposure of 4.0 pCi/L as a guidance level for corrective action.

Based on the above, radon does not appear to be of concern in the Site area. The actual indoor radon level can only be determined through sampling and analysis, not included in the scope of this Phase I ESA.

7.2 Hazardous Materials Inspection

RE&LS conducted a Hazardous Materials Inspection of the Site building to identify the presence of ACM, LBP, and materials containing PCBs. The findings of the Hazardous Materials Survey will be submitted under separate cover.

7.3 Wetlands

There are no mapped New York State (NYS) freshwater wetlands or National Wetland Inventory (NWI) wetlands on or adjacent to the Site.

8.0 FINDINGS AND OPINIONS

The Site was reportedly developed in 1953 in association with the Niagara Machine & Tool plant located on the eastern adjacent property at 683 Northland Avenue. It was operated as a metal fabricating plant under the name Clearing Niagara, and has been vacant since operations ceased in 1992.

Site Reconnaissance Findings

During the Site inspection conducted on February 1, 2024, the Site building was observed to be a large, vacant industrial building used for storing construction building materials. Notable features of the building include furnaces for metal fabrication, a sandblaster, several overhead cranes, and a railroad spur. Historic use of the Site for manufacturing dating back to 1950 is a REC.

The Site reconnaissance identified numerous RECs in connections with the Site. Several drums, oil staining on the wood block flooring, an apparent manhole with a welded cover, an AST (contents unknown), at least one (1) floor drain, and a sump were observed in the Site building.

Historical Documentation and Records Review Findings

A review of available historic documentation, including Sanborn maps, aerial photographs, and street directories indicate that the Site and adjacent properties were historically utilized for manufacturing of machinery and sheet metal, household and automotive polish, liquid and cement, electric control panels, and/or printed circuit boards. Several adjacent properties of concern were identified.

Vibratech, Inc. Site (formerly Houdaille Industries)

This facility is located on the northern adjacent property at 537 East Delvan Avenue, and was historically used for manufacturing dating back to 1927. It is identified on the SEMS, SHWS, and Vapor Reopened databases. Operations included degreaser use and storage with several 10,000 to 12,000-gallon USTs and ASTs, and an open hole bedrock well that was potentially used for disposal. Contaminants of concern at this facility include petroleum products, and TCE and other cVOCs.

Western NY Workforce Training Center

This facility is located on the eastern adjacent property addressed as 665 & 683 Northland Avenue, and is identified on the NY Brownfields database. The property was historically used as a machine and tool works facility beginning in 1911, and used hydraulic, electrical, and industrial equipment that led to the contamination of the property. The contamination included SVOCs, PCBs, metals in soil, and TCE in soil vapor. Hydraulic oil was found to be present in bedrock.

683 Northland Avenue is also identified on the Manifest database as EPA ID NYR000232587. The listing indicates that 35,776 kilograms of PCB wastes, including contaminated soil, solids, sludges, clothing, rags and dredge material were generated and transported off-site to a landfill for disposal in 2017.

Remedial actions have successfully achieved SCOs for Commercial use. However, residual contamination remains in soil, bedrock, and soil vapor, and the property is being managed under a SMP. As the use of the property is restricted by the SMP, the residual contamination is considered a CREC as defined in Section 1.1 of this report. Soil, groundwater and soil vapor at the Site have the potential to be negatively impacted from historic operations at this property.

Phase II ESA; 631, 683, 741, and 777 Northland Avenue (Fisher Associates, September 2015)

RE&LS reviewed Fisher's Phase II ESA conducted in 2015. The results of this Phase II ESA indicate SVOC and metal contamination exceeding NYCRR Part 375-6 Commercial and Industrial Use Soil Cleanup Objectives is present in soil at the south end of the Site building and southeastern portion of the Site. PCBs were detected in samples collected from wood block flooring.

9.0 CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E l527-21 for the property located at 631 Northland Avenue in the City of Buffalo, New York. Any exceptions to, or deletions from, this practice are described in Section 11 of this report. This assessment has revealed no RECs, CRECs, or significant data gaps in connection with the Site **except for the following:**

1. Historic usage of the Site for metal fabricating, and the potential of releases of cutting oils, hydraulic oils, other petroleum products, and degreasing agents
2. Analytical data from a 2015 Phase II ESA investigation identifying hazardous concentrations of SVOCs in soil
3. Floor drains and a sump in the Site building, and the associated potential for improper disposal of degreasers and other contaminants
4. A railroad spur on the Site and the potential for petroleum and chemical spills during the transfer of shipments
5. The potential for petroleum releases in association with the AST present on the Site, and the potential for unidentified orphan USTs to be present on the Site
6. The potential for groundwater and soil vapor impacts at the Site from historic industrial uses of the adjacent properties, specifically in association with the CREC on the eastern adjacent property and the former Houdaille Industries facility on the northern adjacent property

10.0 ADDITIONAL INVESTIGATION AND RECOMMENDATIONS

Based on this Phase I ESA, additional investigation is warranted. We recommend performing a Phase II ESA/Site Characterization Investigation to evaluate the extent of contamination identified in Fisher's Phase II ESA and unidentified contamination at the Site.

11.0 DEVIATIONS

This report is prepared with no significant deviations from ASTM Standard E1527-21. No title documents were provided for review when this Phase I ESA was prepared. We recommend that an attorney determine that there are no environmental liens or deed restrictions in the Abstract of Title.

12.0 DISCLAIMER

RE&LS represents only that it provides services in accordance with generally accepted practices in the environmental audit field. No other representation, expressed or implied, is included or intended as part of its services, proposals, contracts or reports.

RE&LS cannot provide guarantees, certifications or warranties that the property is or is not free of environmental impairment without a Phase II ESA involving collection and laboratory analysis of environmental samples. Even with such a program, the data and samples from any given soil boring or monitoring well will indicate conditions that apply only at that particular location, and such conditions may not necessarily apply to the general Site as a whole.

13.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

One of the requirements of ASTM E1527-21 is that qualified Environmental Professionals (EP) work on the Phase I ESA and certify the findings and conclusions, therein. The EP must be knowledgeable, qualified and sufficiently experienced to conduct this type of investigation; certification, licensing, education and/or relevant experience are required.

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in EPA 40 CFR Part 312.10.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the "all appropriate inquiries" in conformance with the standards and practices set forth in EPA 40 CFR Part 312.

14.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

This Phase I ESA Report is certified to be prepared in general accordance with sound environmental practices and in conformance with the scope and limitations of ASTM Practice E1527-21.

Sincerely,

Whitney McAlpin
Environmental Scientist

Lynn Zicari
Sr. Environmental Scientist

Benjamin Reddy
Environmental Department Manager

Environmental Questionnaire

Site address: 631 Northland Avenue, Buffalo, Erie County NY, Tax No. 101.21-5-1.21

USER QUESTIONNAIRE

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. The *user* should provide the following information to the *environmental professional.*

(1.) Are there any environmental liens that are filed or recorded against the *property?*

No.

(2.) Are there any activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property,* such as *engineering controls*, land use restrictions or *institutional controls*?

No.

(3.) Do you have any specialized knowledge or experience related to the property or the nearby properties?

No.

(4.) What is the relationship of the purchase price to the fair market value of the *property* if it were not contaminated?

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

The subject property was purchased by BUDC as is.

(5.) Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

Please refer to Fisher Associates Phase 1 and 2 Environmental Site Assessment (ESA

(a.) Do you know the past uses of the *property*?

Former machine and tool works facility.

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

Only as noted in Fisher Associates ESA.

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

Only as noted in Fisher Associates ESA.

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

Only as noted in Fisher Associates ESA.

(6.) What is the degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation?

The potential of contamination exists due to its relationship with other properties located

(7.) Additional questions:

a. What is the reason that the Phase I ESA is being performed (sale, purchase, etc.)?

To update the previous Phase 1 ESA from 2015.

User (print name): Angelo Rhodes II

Signature: Angelo K Rhodes II

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E2247 - 16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E1528 - 22) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

NY RGA LF..... Recovered Government Archive Solid Waste Facilities List

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal sites subject to CERCLA removals and CERCLA orders

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 09/19/2023 has revealed that there are 2 SEMS sites within approximately 0.5 miles of the target property.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless

information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 09/19/2023 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Lists of Federal RCRA facilities undergoing Corrective Action

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Lists of Federal RCRA generators

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/04/2023 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/04/2023 has revealed that there is 1 RCRA-SQG site within approximately 0.25 miles of the target property.

Lists of state- and tribal hazardous waste facilities

NY SHWS: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the NY SHWS list, as provided by EDR, and dated 08/07/2023 has revealed that there are 7 NY SHWS sites within approximately 1 mile of the target property.

Lists of state and tribal landfills and solid waste disposal facilities

NY SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the list.

A review of the NY SWF/LF list, as provided by EDR, and dated 09/27/2023 has revealed that there are 3 NY SWF/LF sites within approximately 0.5 miles of the target property.

Lists of state and tribal leaking storage tanks

NY LTANKS: Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills

A review of the NY LTANKS list, as provided by EDR, and dated 01/24/2024 has revealed that there are 18 NY LTANKS sites within approximately 0.5 miles of the target property.

Database: AST, Date of Government Version: 09/06/2023
Facility Id: 9-601200

NY CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the NY CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there are 2 NY CBS AST sites within approximately 0.25 miles of the target property.

NY ERP: In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

A review of the NY ERP list, as provided by EDR, and dated 08/07/2023 has revealed that there is 1 NY ERP site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/04/2023 has revealed that there are 14 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

PFAS ECHO: Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

A review of the PFAS ECHO list, as provided by EDR, and dated 09/23/2023 has revealed that there are 2 PFAS ECHO sites within approximately 0.25 miles of the target property.

NY HSWDS: The List includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity The latest version of the study is frozen in time. The sites on the study will not automatically be made superfund sites, rather each site will be further evaluated for listing in the registry. So overtime they will be added to the registry or not.

A review of the NY HSWDS list, as provided by EDR, and dated 01/01/2003 has revealed that there is 1 NY HSWDS site within approximately 0.5 miles of the target property.

NY VAPOR REOPENED: "Vapor intrusion" refers to the process by which volatile chemicals move from a subsurface source into the indoor air of overlying or adjacent buildings. The subsurface source can either be contaminated groundwater or contaminated soil which releases vapors into the pore spaces in the soil. Improvements in analytical techniques and knowledge gained from site investigations in New York and other states has led to an increased awareness of soil vapor as a medium of concern and of the potential for exposures from the soil vapor intrusion pathway. Based on this additional information, New York is currently re-evaluating previous assumptions and decisions regarding the potential for soil vapor intrusion exposures at sites. As a result, all past, current, and future contaminated sites will be evaluated to determine whether these sites have the potential for exposures related to soil vapor intrusion.

A review of the NY VAPOR REOPENED list, as provided by EDR, and dated 01/01/2022 has revealed that there is 1 NY VAPOR REOPENED site within approximately 0.5 miles of the target property.

UST FINDER: EPA developed UST Finder, a web map application containing a comprehensive, state-sourced national map of underground storage tank (UST) and leaking UST (LUST) data. It provides the attributes and locations of active and closed USTs, UST facilities, and LUST sites from states and from Tribal lands and US territories . UST Finder contains information about proximity of UST facilities and LUST sites to: surface and groundwater public drinking water protection areas; estimated number of private domestic wells and number of people living nearby; and flooding and wildfires.

A review of the UST FINDER list, as provided by EDR, and dated 06/08/2023 has revealed that there are 5 UST FINDER sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

UST FINDER RELEASE: US EPA's UST Finder data is a national composite of leaking underground storage tanks. This data contains information about, and locations of, leaking underground storage tanks. Data was collected from state sources and standardized into a national profile by EPA's Office of Underground Storage Tanks, Office of Research and Development, and the Association of State and Territorial Solid Waste Management Officials.

A review of the UST FINDER RELEASE list, as provided by EDR, and dated 06/08/2023 has revealed that there are 20 UST FINDER RELEASE sites within approximately 0.5 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 3 EDR Hist Auto sites within approximately 0.125 miles of the target property.

DEC Memo:	DISCOVERED DRUMS DURING A FIRE RESPONSE. WOULD LIKE THE DEPARTMENT TO RESPOND.
Remarks:	06/16/14 TDJ WENT TO LOCATION WHERE AN OLD COLLAPSED COMMERCIAL STRUCTURE BURNED DURING A FIRE AT AN ADJACENT COMMERCIAL BUILDING FIRE. APPROX. 10-12 (55) GALLON DRUMS WERE OBSERVED IN THE CENTER OF THE BURNT WOOD AND DEBRIS. ALL DRUMS WERE SCORCHED AND WERE BULGING ON BOTH ENDS. A FEW WERE MOVED AND APPEARED EMPTY BUT A FEW HAD XSOME LIQUIDS CONTAINED. NOTHING WAS LEAKING AND NO VAPORS WERE ESCAPING. THE BUILDING WAS DUE FOR DEMOLITION SO I ADVISED TO BEGIN THE REMOVAL OF DEBRIS AS PREVIOSLY PLANNED TO GET TO THE STAGED DRUMS. PROPERTY OWNER WILL SEE IF CONTRACTOR CAN DEAL WITH THE MOVEMENT AND POSSIBLE

DRUMS FOUND AT FIRE (Continued) **S117267637**

SAMPLING DRUM CONTENTS FOR DISPOSAL. PROPERTY OWNER ROB 716-208-7710 12/29/14 TDJ DRUMS FINALLY DUG OUT OF FIRE DAMAGE AFTER PURCHASER OF PROPERTY LEFT AREA AFTER FIRE. A FEW DRUMS WERE FUND WITH WATER AND OTHERS WERE EMPTY. WATER WAS EMPTIED AS UNCONTAMINATED INTO SEWER LINE. DRUMS SCRAPED BY CONTRACTOR. NO DISPOSAL NEEDED. NO FURTEHR ACTION FILE CLOSED TO ELECTRONIC ONLY

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DEC Memo:	Caller advised after phase 2 testing found petroleum in the soil along with a scent of petroleum. Clean up is pending. Caller advised tried to have the owner of the property call in the spill but they refused.
Remarks:	06/29/15 TDJ WHILE DIGGING TEST PITS ON COMMERCIAL PROPERTY UNKNOW UST WAS EXPOSED. FILL PORT WAS INVESTIGATED AND WAS FOUND TO CONTAIN MAINLY WATER WITH WEATHERED GASOLINE ODOR. SOIL AROUND TANK HAD ODOR OF WEATHERED GASOLINE. PID READINGS BETWEEN 10-20 PPM WAS FOUND IN SOIL. PHASE II IS BEING PERFORMED FOR SALE AND WILL BE OUT IN APPROX. 2 WEEKS FOR REVIEW. 11/09/15 TDJ SPOKE WITH MAGGIE POPEK WITH GZA ENVIRONMENTAL WHO SAID THEY ARE IN PROCESS OF CREATING WORK PLAN FOR CLIENT FOR REMOVAL OF CONTAMINATION ONSITE. THE BUDSIE PROGRAM FOR BUFFALO REDEVELOPMENT CURENTLY OWNS THE PROPERTY. SHE WILL ASK CLEINT TO SEND DEC RESULTS FOR PHASE II. 11/11/15 TDJ RECEIVED PHASE II FROM GZA WHICH SHOWED AN UNDERGROUND TANK IS ONSITE AND RESIDUAL SOIL CONTAMINATION WAS FOUND ABOVE CP-51 LIMITS. LETTER WAS CREATED FOR RESPONSIBLE PARTY CLEANUP OF THE FOUND CONTAMINATION. RESPONSE WAS SET AT 11/25/15. 11/17/15 TDJ RECEIVED E-MAIL FROM BUFFALO

PHASE 2 (Continued) **S117974981**

DEVELOPMENT REP. STATING THAT CONTRACTORS ARE BEING SET AND WORK PLAN SHOULD BE AVAIABLE FOR WORK TO BEGIN IN EARLY 2016. 05/23/16 TDJ WORK TO BEGIN ON TANK REMOVAL ON 5/24/16. DRUMS FOUND ONSITE AFTER FIRE TOTALLY GUTTED FACTORY STRUCTURE WILL BE EXAMINED ALSO. LABELLA ASSOCIATES WILL BE DIRECTING THE EXCAVATION WORK. 05/24/16 TDJ STOPPED AT LOCATION WHICH HAS BEEN TOTALLY CLEARED AND GRADED OVER. THE CITY CURRNTLY OWNS THE SITE AND WILL BE DEVELOPING THE SITE. THE EXCAVTION WAS BEGINNIG WHEN I HAD TO LEAVE TO VISIT ANOTHER SITE. 5/25/16 TDJ SPOKE WITH ANDREW BENLEMAN OF LABELLA WHO STATED 2000 GALLON TANK WAS FOUND WITH MAINLY WATER WITH A SHEEN. WATER WAS PUMPED OUT AND TANK REMOVED. SOME CONTAMINATION WAS IN THE PIT WHICH WAS COVERED WITH PLASTIC AND THE HOLE REFILLED UNTIL THE NEXT PHASE OF THE PROJECT BEGINS. TANK WAS CLEANED AND REMOVED FROM SITE. 9//14/16 TDJ WORK WAS COMPLETED IN THE TANK PIT. SOIL WAS EXCAVATED AND CONFIRMATORY SAMPLES WERE COLLECTED. NO GROUNDWATER WAS ENCOUNTERED. ALL SAMPLES WERE ND FOR CP-51 COMPOUNDS. A TOTAL OF 1,705 GALLONS OF PRODUCT AND WATER WAS DISPOSED AT AMERICAN RECYCLERS. A TOTAL OF 262 TON OF PETROLEUM CONTAMINATED SOIL WAS TAKEN TO TOWN OF TONAWANDA LANDFILL FOR DISPOSAL. SITE WORK WAS COMPLETED TO SATISFACTION OF DEC SITE MANAGER. NO FURTHER ACTION LETTER WILL BE SENT TO CLOSE SPILL. NO FURTHER ACTION FILE CLOSED TO ELECTRONIC ONLY

WESTERN NEW YORK WORKFORCE TRAINING CENTER (Continued) **S123658140**

Site Description: Location: The Western New York Workforce Training Center is an 8.548-acre site located in an urban area at 683 Northland Avenue in the City of Buffalo, Erie County. The site is bounded by Northland Avenue to the north, a railroad spur to the south and commercial/industrial properties to the east and west. Site Features: The site is mostly flat and includes an approximately 235,000 square foot building complex. The building complex consists of a four-story office area along Northland Avenue, a series of connecting manufacturing spaces, and a detached one-story garage. Areas not covered by buildings are either paved or covered by grass and other small vegetation. Current Zoning and Land Use: The site and adjacent parcels are zoned for industrial use. The site is partially redeveloped as the WNY Workforce Training Center in the northern portion of the building, with a portion of the remaining building occupied by Buffalo Manufacturing Works. The surrounding area includes commercial, industrial, and residential uses. The nearest residential property is located approximately 175 feet north of the site. Past Use of the Site: The site was developed as a machine and tool works facility beginning in approximately 1911. The facility used hydraulic equipment, electrical equipment, and other industrial equipment that led to the present site contamination. The building has had several additions and upgrades since its initial construction. The property was most recently used for storage until it was purchased by the current owner in 2015. Site Geology and Hydrogeology: Site overburden contains native soil and fill material from the ground surface to depths of 2 to 12 feet below ground surface. The fill generally consists of silt, sand, and gravel with a mixture of crushed stone, yellow and red brick, coal, glass, slag, ash, metal fragments, and wood. Native soil, where present, typically consists of brown silty clay and is directly on top of bedrock. Limestone bedrock is present at depths ranging from 2 feet to 12 feet below ground surface. Groundwater was observed in bedrock at depths ranging from approximately 9 feet to 12 feet below ground surface. Groundwater flow is to the south and southwest.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals in soil and trichloroethylene in soil vapor. Additionally, petroleum product (hydraulic oil) is present in some areas of the on-site bedrock. Remedial actions have successfully achieved site specific soil cleanup objectives for commercial use. Residual contamination in the soil, bedrock, and soil vapor is being managed under a Site Management Plan

Health Problem: Measures are in place to properly manage human exposures to residual site contaminants.

Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals in soil and trichloroethylene in soil vapor. Additionally, petroleum product (hydraulic oil) is present in some areas of the on-site bedrock. Remedial actions have successfully achieved site specific soil cleanup objectives for commercial use. Residual contamination in the soil, bedrock, and soil vapor is being managed under a Site Management Plan
Health Problem: Measures are in place to properly manage human exposures to residual site contaminants.

Site Description: Location: The Western New York Workforce Training Center is an 8.548-acre site located in an urban area at 683 Northland Avenue in the City of Buffalo, Erie County. The site is bounded by Northland Avenue to the north, a railroad spur to the south and commercial/industrial properties to the east and west. Site Features: The site is mostly flat and includes an approximately 235,000 square foot building complex. The building complex consists of a four-story office area along Northland Avenue, a series of connecting manufacturing spaces, and a detached one-story garage. Areas not covered by buildings are either paved or covered by grass and other small vegetation. Current Zoning and Land Use: The site and adjacent

WESTERN NEW YORK WORKFORCE TRAINING CENTER (Continued) **S123658140**

parcels are zoned for industrial use. The site is partially redeveloped as the WNY Workforce Training Center in the northern portion of the building, with a portion of the remaining building occupied by Buffalo Manufacturing Works. The surrounding area includes commercial, industrial, and residential uses. The nearest residential property is located approximately 175 feet north of the site. Past Use of the Site: The site was developed as a machine and tool works facility beginning in approximately 1911. The facility used hydraulic equipment, electrical equipment, and other industrial equipment that led to the present site contamination. The building has had several additions and upgrades since its initial construction. The property was most recently used for storage until it was purchased by the current owner in 2015. Site Geology and Hydrogeology: Site overburden contains native soil and fill material from the ground surface to depths of 2 to 12 feet below ground surface. The fill generally consists of silt, sand, and gravel with a mixture of crushed stone, yellow and red brick, coal, glass, slag, ash, metal fragments, and wood. Native soil, where present, typically consists of brown silty clay and is directly on top of bedrock. Limestone bedrock is present at depths ranging from 2 feet to 12 feet below ground surface. Groundwater was observed in bedrock at depths ranging from approximately 9 feet to 12 feet below ground surface. Groundwater flow is to the south and southwest.

Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals in soil and trichloroethylene in soil vapor. Additionally, petroleum product (hydraulic oil) is present in some areas of the on-site bedrock. Remedial actions have successfully achieved site specific soil cleanup objectives for commercial use. Site Description:	Location: The Western New York Workforce Training Center is an 8.548-acre site located in an urban area at 683 Northland Avenue in the City of Buffalo, Erie County. The site is bounded by Northland Avenue to the north, a railroad spur to the south and commercial/industrial properties to the east and west. Site Features:

WESTERN NEW YORK WORKFORCE TRAINING CENTER (Continued) **S123658122**

The site is mostly flat and includes an approximately 235,000 square foot building complex. The building complex consists of a four-story office area along Northland Avenue, a series of connecting manufacturing spaces, and a detached one-story garage. Areas not covered by buildings are either paved or covered by grass and other small vegetation. Current Zoning and Land Use: The site and adjacent parcels are zoned for industrial use. The site is partially redeveloped as the WNY Workforce Training Center in the northern portion of the building, with a portion of the remaining building occupied by Buffalo Manufacturing Works. The surrounding area includes commercial, industrial, and residential uses. The nearest residential property is located approximately 175 feet north of the site. Past Use of the Site: The site was developed as a machine and tool works facility beginning in approximately 1911. The facility used hydraulic equipment, electrical equipment, and other industrial equipment that led to the present site contamination. The building has had several additions and upgrades since its initial construction. The property was most recently used for storage until it was purchased by the current owner in 2015. Site Geology and Hydrogeology: Site overburden contains native soil and fill material from the ground surface to depths of 2 to 12 feet below ground surface. The fill generally consists of silt, sand, and gravel with a mixture of crushed stone, yellow and red brick, coal, glass, slag, ash, metal fragments, and wood. Native soil, where present, typically consists of brown silty clay and is directly on top of bedrock. Limestone bedrock is present at depths ranging from 2 feet to 12 feet below ground surface. Groundwater was observed in bedrock at depths ranging from approximately 9 feet to 12 feet below ground surface. Groundwater flow is to the south and southwest.

Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals in soil and trichloroethylene in soil vapor. Additionally, petroleum product (hydraulic oil) is present in some areas of the on-site bedrock. Remedial actions have successfully achieved site specific soil cleanup objectives for commercial use. Residual contamination in the soil, bedrock, and soil vapor is being managed under a Site Management Plan
Health Problem:	Measures are in place to properly manage human exposures to residual site contaminants.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Update By:	AECAPRIO
Site Description:	Location: The Western New York Workforce Training Center is an 8.548-acre site located in an urban area at 683 Northland Avenue in the City of Buffalo, Erie County. The site is bounded by Northland Avenue to the north, a railroad spur to the south and commercial/industrial properties to the east and west. Site Features: The site is mostly flat and includes an approximately 235,000 square foot building complex. The building complex consists of a four-story office area along Northland Avenue, a series of connecting manufacturing spaces, and a detached one-story garage. Areas not covered by buildings are either paved or covered by grass and other small vegetation. Current Zoning and Land Use: The site and adjacent parcels are zoned for industrial use. The site is partially redeveloped as the WNY Workforce Training Center in the northern portion of the building, with a portion of the remaining building occupied by Buffalo Manufacturing Works. The surrounding area includes commercial, industrial, and residential uses. The nearest residential property is located approximately 175 feet north of the site. Past Use of the Site: The site was developed as a machine and tool works facility beginning in approximately 1911. The facility used hydraulic equipment, electrical equipment, and other industrial equipment that led to the present site contamination. The building has had several additions and upgrades since its initial construction. The property was most recently used for storage until it was purchased by the current owner in 2015. Site Geology and Hydrogeology: Site overburden contains native soil and fill material from the ground surface to depths of 2 to 12 feet below ground surface. The fill generally consists of silt, sand, and gravel with a mixture of crushed stone, yellow and red brick, coal, glass, slag, ash, metal fragments, and wood. Native soil, where present, typically consists of brown silty clay and is directly on top of bedrock. Limestone bedrock is present at depths ranging from 2 feet to 12 feet below ground surface. Groundwater was observed in bedrock at depths ranging from approximately 9 feet to 12 feet below ground surface. Groundwater flow is to the south and southwest.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals in soil and trichloroethylene in soil vapor. Additionally, petroleum product (hydraulic oil) is present in some areas of the on-site bedrock. Remedial actions have successfully achieved site specific soil

WESTERN NEW YORK WORKFORCE TRAINING CENTER (Continued) **S123658082**

	cleanup objectives for commercial use. Residual contamination in the soil, bedrock, and soil vapor is being managed under a Site Management Plan
Health Problem:	Measures are in place to properly manage human exposures to residual site contaminants.

DEC Memo:	found contamination in test pit/sample taken, waiting on sample results
Remarks:	7/21/16 THIS IS A CITY OF BUFFALO PROPERTY. THEY WERE PLANNING TO DO WORK ON THE PROPERTY. CORE ENVIRO DID A GEOPHYSICAL AND FOUND ANOMALIES. WHILE EXCAVATING AT ABOUT 2.5 FTBGS. SAMPLES WERE COLLECTED AND WILL BE BACK IN ABOUT TWO WEEKS. CLARK PATTERSON, CHRISTIE NELSON IS COORDINATING WITH THE CITY OF BUFFALO AND SHE SOULD BE THE POINT OF CONTACT. 7/22/16 From: Jennifer Michniewicz [mailto:JMichniewicz@ClarkPatterson.com] Sent: Friday, July 22, 2016 4:01 PM To: Gallego, Francine (DEC) ; Sutton, Dennis ; Sheila Ransbottom Subject: FW: Spill 1603929 1149 Fillmore According to this email chain, it looks like there may be some confusion. To clarify, CORE is a Subconsultant to Clark Patterson Lee. Sheila Ransbottom is the project manager with CORE. I have cc d her and her phone number is (716) 204-8054. I am the project manager for Clark Patterson Lee and my contact info is below. Jennifer L. Michniewicz, P.E., PTOE Principal Associate Direct: 716.218.4747 Cell: 716.939.0792 Clark Patterson Lee Office: 800.274.9000 www.clarkpattersonlee.com 7/28/16 FG SPOKE TO JOHN BIDELL WITH THE CITY OF BUFFALO. HE SAID THAT THEY

COMMERCIAL (Continued) **S118706771**

WILL COMPLETE A SITE ASSESSMENT AND WOULD LIKE TO REMOVE THE USTS AND CONTAMINATION WHEN THEY DO ROAD CONSTRUCTION NEXT MAY TO AUGUST. 8/18/16 CORE ENVIRONMENTAL PROVIDED THE DOCUMENTATION IDENTIFYING THE USTS ON SITE. FG SPOKE TO ALISSA CROOKSHANK 204-8054 WITH CORE. FG TOLD HER THAT THE DEPARTMENT WILL REQUIRE A SITE ASSESSMENT NOW AND WILL ALLOW THE REMOVAL DURING ROAD WORK. CORE WILL PROVIDE THE ANALYTICAL FOR THE SITE. CORE PROVIDED THE TEST PIT ANALYTICAL. TP3, TP3-2 AND TP4 WERE THE LOCATIONS WHERE IMPACTS WERE IDENTIFIED AND THE SAMPLES FROM THESE LOCATIONS EXCEED CP51. FG NOTIFIED THE CITY THAT A SITE ASSESSMENT WOULD NEED TO BE COMPLETED TO DETERMINE THE EXTENT. 9/22/16 FG PHONE MEETING WITH CITY OF BUFFALO AND CORE ENVIRONMENTAL. BUDC IS NOT DOING THE ROADWORK ANY LONGER. THEY WILL PLAN TO DO AN ASSESSMENT AND GET ME A WORKPLAN. 12/8/16 CORE ENVIRONMENTAL SUBMITTED THE WORK PLAN FOR THE SITE. THEY PLAN TO COMPLETE 10 BORINGS SURROUNDING THE UST'S DISCOVERED. THEY WILL ANALYZE ONE SAMPLE PER BORING AND SUBMIT A REPORT OF FINDINGS. 12/16/16 THE CITY OF BUFFALO HAS SCHEDULED THE SUBSURFACE INVESTIGATION FOR JAN 4 & 5 2017. 3/10/17 CORE ENVIRONMENTAL SUBMITTED THE SUBSURFACE INVESTIGATION FOR THE SITE. AN UST AND PETROLEUM IMPACTED SOIL WAS DISCOVERED. THE REPORT IDENTIFIES THE AREA OF IMPACTS FOR REMOVAL. 3/17/17 CORE ENVIRONMENTAL SAID THAT THE CITY WILL GET IN TOUCH WITH THE DEPARTMENT REGARDING REMEDIATION OF THE SITE. THE CITY PROVIDED THE FOLLOWING EMAIL INDICATING WORK WILL BEGIN THIS SUMMER: From: Paananen,Jason A. [mailto:jpaananen@ch.ci.buffalo.ny.us] Sent: Friday, March 17, 2017 4:24 PM To: Gallego, Francine (DEC) Cc: Jennifer Michniewicz (JMichniewicz@ClarkPatterson.com) ; Bidell,John ; Finn,Michael J. ; sransbottom@coreenv.com; Alyssa Cruikshank Subject: RE: 1669 Fillmore Avenue Subsurface Investigation Francine, The City is estimating that work may commence at the beginning of June and be completed by the end of July. The timeframe for remediation will vary based on the bids, but work should be completed this Summer. I ll keep you posted once we have a more definitive schedule. Let me know if you have any questions or comments. Thanks, Jason Paananen, AICP Director of Environmental Affairs City of Buffalo Mayor s Office of Strategic Planning 901 City Hall Buffalo, NY 14202 716-851-5406 7/11/17 The City of Buffalo provided an update: Good morning. Just following up with you from our conversation Friday. The City is currently in the process of preparing to transfer the land over to the Buffalo Urban Development Corporation. Once the land is transferred to them I will request a revised timeframe for the work. I still think it will occur this summer but I will provide you with more information once I know more. Thanks, Jason Paananen, AICP Director of Environmental Affairs City of Buffalo Mayor s Office of Strategic Planning 901 City Hall Buffalo, NY 14202 716-851-5406 1/19/18 FG requested an update from Jason Paanenan with the City of Buffalo. 1/22/18 Hi Francine, I am awaiting the Law Department s review of Vermont Street as the tanks were permitted to the previous owner of the property. Let me check with them on the status. I will follow-up with BUDC on the Fillmore property as they were supposed to be starting work on that once the real estate contract was completed with the City. There might have been an issue with the contract so let me see what the delay is. Thanks, Jason Paananen, AICP Director of Environmental Affairs City of Buffalo Mayor s Office of Strategic Planning 901 City Hall Buffalo, NY 14202 716-851-5406 2/2/18 Hi Francine, Sorry for the delay. In regards to 1669 Fillmore Avenue, BUDC is finalizing contracts between the City and the property should be transferred to

COMMERCIAL (Continued) **S118706771**

them in the next month as there was an issue with lot combinations as part of the Northland project. Once this happens they should begin work in early spring to remove the tank and contaminated soil. I will keep you posted as this progresses. Thanks, Jason Paananen, AICP Director of Environmental Affairs City of Buffalo Mayor s Office of Strategic Planning 901 City Hall Buffalo, NY 14202 716-851-5406 7/24/18 Hi Francine, I forwarded your request to Mike Finn at DPW on Friday so hopefully I will hear back this week. I know he had to run the options by his boss before a decision was made. I ll let you know once I receive an answer. Thanks, Jason Paananen, AICP Director of Environmental Affairs City of Buffalo Mayor s Office of Strategic Planning 901 City Hall Buffalo, NY 14202 716-851-5406 9/19/18 FG requested an update from Jason Paananen. 9/21/18 From: Peter Cammarata [mailto:pcammarata@buffalourbandevelopment.com] Sent: Thursday, September 20, 2018 4:48 PM To: Paananen,Jason A ; Finn,Michael J ; Heffron,John ; 'John Heffron' Subject: RE: 449-451 Vermont St, 1669 Fillmore Jason: I don t know if my participation would be helpful at this point. The land swap where we would be acquiring 1669 is not imminent. BURA still has to acquire the properties (including 1669) from the City, before we can move forward with the swap. I can t provide any concrete timeline for Francine until we close on the property, although we do intend to move forward with any issues on the property quickly at that point. PMC Peter M. Cammarata President Buffalo Urban Development Corp. 95 Perry St., Suite 404 Buffalo, NY 14203 716-362-8361 pcammarata@buffalourbandevelopment.com 11/9/18 ROE letter sent to the City requesting access. Response is due 11/29/18 12/7/18 City of Buffalo, Finn indicated that BUDC will be completing the remediation once the real estate transfer is completed. 1/14/19 Peter Cammarata called and indicated the BUDC property transfer is expected to happen by March. As soon as it does, they plan to begin the remediation. They will keep the Department updated. 8/28/19 From: Peter Cammarata Sent: Wednesday, August 28, 2019 11:41 AM To: Gallego, Francine (DEC) Cc: dstebbins@buffalourbandevelopment.com Subject: RE: 1603929 1669 FILLMORE AVE, BUFFALO Hi Francine: From a meeting I attended this past Monday, I understand that the City of Buffalo Common Council will be dealing with the land sale this month. I am assuming we will be taking title to the property in October or November. PMC Peter M. Cammarata President Buffalo Urban Development Corp. 95 Perry St., Suite 404 Buffalo, NY 14203 716-362-8361 pcammarata@buffalourbandevelopment.com 4/28/20 From: Peter Cammarata Sent: Tuesday, April 28, 2020 7:12 AM To: Gallego, Francine (DEC) Subject: RE: Spill 1603929 1669 Fillmore Good morning .Francine. The property swap with the City has not taken place as of yet. BUDC completed both sides of the survey and title work at our cost to try to expedite things, but the transactions approval by the Common Council has been delayed by the current Covid-19 circumstances. As soon as a closing takes place, we are prepared to update our pending contract with LaBella. Our Board has already approved the transaction and the hiring of a consultant. I hope you are safe and healthy. PMC Peter M. Cammarata President Buffalo Urban Development Corp. 95 Perry St., Suite 404 Buffalo, NY 14203 716-362-8361 pcammarata@buffalourbandevelopment.com 1/20/21 Hi Francine: I hope you are safe and well. BUDC s land swap with the City of Buffalo, which did include 1669 Fillmore is 90% complete after three long years. The deeds were signed on 11/24/20, and the transaction was closed and filed on 12/18/20. I am waiting for final confirmation

COMMERCIAL (Continued) **S118706771**

from the City s Tax and Assessment Department, which should come shortly. As you are aware, I have a price for the tank closure from LaBella from 2017. I have asked Rob Napieralski to update that price for me, so that I can discuss it with our Real Estate Committee at their February meeting. I am hoping that I do not have to rebid the project and can identify a funding source to advance things as soon as possible. PMC Peter M. Cammarata President Buffalo Urban Development Corp. 95 Perry St., Suite 404 Buffalo, NY 14203 716-362-8361 pcammarata@buffalourbandevelopment.com 3/23/21 I believe you are the Spill Engineer for this Site. I wanted to give you a heads up that we will be heading out to the Site to collect waste profile samples in preparation of UST and petroleum impacted soil removal anticipated to begin the week of April 12th. We will be on-Site Friday 3/26 to complete a few direct-push soil borings and collect a waste characterization sample. Let me know if you have any questions. Thanks Andrew Benkleman LaBella Associates - Project Manager 716-768-3184 direct 716-551-6281 office 300 Pearl Street, Suite 130 Buffalo, NY 14202 3/30/21 Peter, Please see the attached PBS Application and Pre-Work Notification for the removal of an approximately 500-gallon abandoned UST at the property addressed as 1669 Fillmore Ave, Buffalo, NY. The removal work is scheduled for the week of April 12th. There is a spill listing (#1603929) associated with the Site for the identification of subsurface impact during a previous Phase II Investigation. Let me know if you have any questions. Thanks Andrew Benkleman LaBella Associates - Project Manager 716-768-3184 direct 716-551-6281 office 300 Pearl Street, Suite 130 Buffalo, NY 14202 labellapc.com 4/13/21 FG site visit. Labella on site. Excavation was open and 5 usts had been uncovered. Product will be vacced out. The usts will be cleaned out and cut open. The petroleum impacted soils will then be excavated and disposed. Work is to continue through next week. 7/15/21 Labella provided the closure report for the site. From: Benkleman, Andrew Sent: Tuesday, July 13, 2021 1:14 PM To: Gallego, Francine (DEC) ; Reuben, Peter A (DEC) Cc: pcammarata@buffalourbandevelopment.com; ahall@buffalourbandevelopment.com; rnapieralski@labellapc.com Subject: 2211220: Petroleum Remediation: 1669 Fillmore Avenue, Buffalo, NY: NYSDEC Spill #16-03929 Francine and Peter, I hope you are both doing well. On behalf of NorDell II, LLC please use the link below to download the Underground Storage Tank (UST) Removals Report for 1669 Fillmore Avenue, Buffalo, NY for your review. As part of the UST removals, five USTs were encountered and removed along with approximately 3,830 gallons of product, water, tank bottoms, and rinsate, and approximately 484 tons of petroleum impacted soil. The analytical results for the confirmatory soil samples collected from the sidewalls and the floor of the excavation were all below NYSDEC CP-51 SCG. Based on the removal and proper disposal of the USTs and impacted soil from the Site and the results of the post-excavation confirmatory soil samples, we respectfully request the closure of Spill #16-03929 associated with the Site. Let me know if you have any comments or questions. Kindly respond to this email that you were able to successfully download the report. Transferred Files NAME TYPE DATE TIME SIZE 2211220_UST Closure Report_1669 Fillmore Ave,Buffalo,NY_7.2.2021.pdf PDF File 7/2/2021 11:53 AM 12,743 KB Thanks Andrew Benkleman LaBella Associates - Project Manager 716-768-3184 direct 716-551-6281 office 300 Pearl Street, Suite 130 Buffalo, NY 14202 labellapc.com During the removal of the unregistered 500 gallon UST (Tank 4), four additional unregistered

COMMERCIAL (Continued) **S118706771**

USTs were discovered, including one 550-gallon (Tank 1), two 1,000-gallon (Tanks 3 and 4) and one 2,000-gallon tank (Tank 5). All disposal receipts were received. The excavation sample results are below CP51 levels. No further work is required. The site is closed.

Tank Info:

Tank Number:	108
Tank Id:	298966

Equipment Records:

E01 - Piping Secondary Containment - Diking (AG only)
F00 - Pipe External Protection - None
K01 - Spill Prevention - Catch Basin
A00 - Tank Internal Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating
D01 - Pipe Type - Steel/Carbon Steel/Iron
C01 - Pipe Location - Aboveground
I04 - Overfill - Product Level Gauge (A/G)
J02 - Dispenser - Suction Dispenser
G01 - Tank Secondary Containment - Diking (Aboveground)
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
L00 - Piping Leak Detection - None

Tank Location:	Aboveground - contact with impervious barrier... Tank bottom rests on impervious barrier, allowing visual indication of leaks.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	Temporarily Out of Service
Pipe Model:	Not reported
Install Date:	01/01/2002
Capacity Gallons:	1100

Tank Id: 290343

Equipment Records:

E01 - Piping Secondary Containment - Diking (AG only)
A00 - Tank Internal Protection - None
B01 - Tank External Protection - Painted/Asphalt Coating
D01 - Pipe Type - Steel/Carbon Steel/Iron
F01 - Pipe External Protection - Painted/Asphalt Coating
K01 - Spill Prevention - Catch Basin
G01 - Tank Secondary Containment - Diking (Aboveground)
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
L00 - Piping Leak Detection - None
C01 - Pipe Location - Aboveground
I04 - Overfill - Product Level Gauge (A/G)
J02 - Dispenser - Suction Dispenser

Tank Location: Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type: Steel/Carbon Steel/Iron
Tank Status: In Service
Pipe Model: Not reported
Install Date: 07/15/2021
Capacity Gallons: 3200
Tightness Test Method: -
Date Test: Not reported

Spiller Company:	INNOVATIVE CHEMICAL CO.
Spiller Address:	711 NORTHLAND AVE.
Spiller Company:	001
Contact Name:	JEFF J. PLESH
DEC Memo:	Tom at site this morning and observed spill apparently resulting from a fork truck hitting a drum (possibly two) in the plant basement. Drum(s) contained solvent naphtha The area is used to store numerous drummed chemicals. Release outside of basement was not evident; however Tom did not see any actions or attempts to contain or clean-up spilled material.

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The Department of Labor, Occupational Safety and Health Administration information system consists of inspection case detail for approximately 100,000 OSHA inspections conducted annually. The FRS dataset includes facilities that had inspections within the last 7 years within the mining, oil and gas, utilities, and manufacturing sectors.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Site Description: Location: The Vibratech site is an approximately 10.522-acre site located in a mixed industrial/commercial/residential area at 537 East Delavan Avenue in the City of Buffalo, Erie County. Site Features: The main site features include one- and two-story brick and steel-frame buildings at the northern and southwestern ends of the site. In 2017, a significant portion of the site structures were demolished and removed by the current site owner (Buffalo Urban Development Corporation). Most of the Site area is now exposed concrete floor slabs, asphalt parking areas and access roads, and small grassy areas at the northern end of the site. Significant historic operational features at the site include the former degreaser storage room with three former 10,000-gallon underground storage tanks (USTs), four former 12,000-gallon fuel oil above-ground storage tanks (ASTs), and the deep sump. The deep sump is an approximate 9-inch diameter, formerly 202.5 feet deep, open-hole bedrock well initially used as a source of cooling water, but possibly later used for disposal. Current Zoning and Land Use: The site is currently zoned for light industrial use. The buildings in the northern portion of the site are currently being renovated for reuse. The buildings in the southwestern portion of the site are being leased for storage/commercial use. The site is surrounded by residential, commercial and industrial properties. Past Use of the Site: The site was utilized by Houdaille Industries for the manufacture of vibration dampeners and rotary shock absorbers for the truck and railroad industry from 1927 through the mid-1990s. Specific

VIBRATECH INC. (Continued) **S102176404**

operations at the plant included chip turning, assembly of components, heat treating and plating. Subsequent owners and occupants of the site include: British Arms, Buffalo Arms, Interstate Tires, Buffalo Powder Coatings, World Series of Sports Promotions, and Buffalo Salvage. Site Geology and Hydrology: The site is covered by buildings and asphalt underlain by sandy gravel fill containing ash and cinders to a depth of 1 to 7 feet below ground surface (fbgs). Natural soils identified below the fill consist of fine textured lake deposited sediment with a clayey-silt texture and/or glacial deposits extending to the top of bedrock located 2 to 12 fbgs. Bedrock is fractured and is typical of the Onondaga Limestone Formation. Depth to groundwater is generally 4 to 12 fbgs with flow to the south-southwest, influenced by near surface utilities and the Scajaquada Drain to the south.

Env Problem: Nature and Extent of Contamination: Based on investigations completed to date, the primary contaminants of concern are: chlorinated solvents (trichloroethene [TCE] and 1,1,1-trichloroethane and their daughter products) and 1,4-dioxane in the southern two-thirds of the site; and free-phase petroleum products (oil) in the southwestern corner of the site. Solvent contaminated soil containing TCE was remediated along a former rail spur on the southern portion of the site in the mid-1990s. Groundwater concentrations of TCE initially decreased following this soil remediation action. However, chlorinated solvents concentrations subsequently rebounded and 1,4-dioxane and free-phase product were identified onsite. A removal action was undertaken by USEPA to remove asbestos and PCBs from light ballasts, capacitors and associated contamination throughout the facility. Additionally, mercury containing switches and lamps were removed and disposed. The removal action was complete on September 9, 2009. A supplemental investigation completed in 2010 identified additional TCE contamination in groundwater north of the previously impacted groundwater plume. Additional investigations are being performed to determine the nature and extent of this contamination. Subsurface petroleum products have been identified in multiple onsite monitoring wells in the southwestern portion of the site. A specific source of the petroleum has not been determined, however, it is likely the result of numerous spills and leakage over the life of the facility. Significant dissolved phase petroleum contamination has not been identified in the groundwater. An off-site soil vapor intrusion investigation (indoor air and subslab), completed in the spring of 2012, found no significant off-site impacts due to existing groundwater contamination. A re-evaluation is necessary if reuse of onsite buildings or new construction occurs. A soil gas survey completed in the fall of 2015 helped to identify potential source areas under the central eastern (former degreaser storage room) and southwest corner (deep sump) of the former main plant building requiring additional investigation/remediation.

Health Problem: Direct contact with contaminants in the soil is unlikely because the majority of the site is covered with buildings and pavement. No off-site soil impacts have been identified to-date. People are not expected to come into direct contact with contaminated groundwater unless they dig below the ground surface. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not contaminated by the site. Volatile organic compounds in the groundwater may move into the soil vapor (air spaces within the soil), which in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the

VIBRATECH INC. (Continued) **S102176404**

	movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. The potential exists for the inhalation of site contaminants due to soil vapor intrusion in the on-site building. Sampling indicates soil vapor intrusion is not a concern for off-site buildings.

DEC Memo:	FIRE DEPT RESPONDED TO FIRE @ ABOVE ADDRESS NOTED BUILDING APPEARS TO BEING STOPPED OUT USEABLE MATERIAL (COPPER WIRE ETC) SAYS SEVERAL TRANSFORMER SHELLS W/ OIL ON WOOD FLOOR OF BUILDING
Remarks:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was FG 12/11/97: MNP INSP. MET W/ DETECTIVE MEGAN - BUFFALO PD ON SITE. WE SMELLED SMOKE FROM RECENT BURNING INSIDE MAIN PLANT. WE OBSERVED BURNED COPPER WIRE & PARTIALLY BURNED TRANSFORMERS ON CONCRETE PAD. ASHES & STEEL POKER LYING NEARBY. A COUPLE SMALL TREES HAD BEEN BROUGHT IN & STAGED IN THE NE CORNER OF THE BUILDING. SPOKE W/ 2 MEN, THEY WERE WORKING FOR THE OWNER MARIO PUGLEISI. AT OUR REQUEST THEY LOCATED MR. PUGLEISI WHO WAS ON SITE. WE SPOKE W/ MR. PUGLEISI, HE DENIED BURNING ANY WIRE OR TRANSFORMERS. HE SAID THEY WERE JUST STRIPPING & SALVAGING COPPER & STEEL FROM BUILDING. HE ADMITTED SPILLAGE OF OIL FROM A COMPRESSOR. I NOTED OIL SPILLAGE ON FLOOR NEXT TO BFC ROLLOFF & IN TRANSFORMER ROOM. MR. PUGLEISE SAID THIS SITE WAS FORMERLY OWNED BY VIBRATECH & DEC WAS AWARE OF ANY ENVIRONMENTAL PROBLEMS. ONE OF THE TRANSFORMERS WAS A WESTINGHOUSE MADE MADE IN

VIBRATECH INC. (Continued) **S102176404**

1956, TYPE F-100, DE-ION GRID OIL CIRCUIT BREAKER, 75 KV, SERIAL NUMBER 33Y6527. I ASKED IF I COULD TAKE PICTURES, PUGLEISE GRANTED ME PERMISSION, BUT ASKED ME TO STOP AFTER TAKING ONE PICTURE. HE WANTED TO CALL HIS LAWYER FIRST. I TOLD HIM WE WERE EXPECTING AN ECO TO ARRIVE SHORTLY. HE THEN ASKED HIS WORKERS TO LOCK THE OUTSIDE GATE TO THE FACILITY. WHILE WAITING I CONTACTED ECO RON BOSELLI BY RADIO & ADVISED HIM OF THE SITUATION. HE WAS ONLY 10 MINUTES AWAY. UPON RETURNING TO THE BUILDING MR. PUGLEISE WAS ON THE PHONE W/ HIS ATTORNEY - STEVEN COHEN. DETECTIVE MEGAN ALSO SPOKE W/ COHEN & ADVISED HIM OF THE NEED FOR COPERATION. ECO RON BUSELLI ARRIVED & OBTAINED INFO. FROM MR. PUGLEISE. I WAS THEN GRANTED PERMISSION TO TAKE PICTURES. THREE WESTINGHOUSE TRANSFORMERS SINGLE PHASE TYPE SL LOCATED IN THE TRANSFORMER ROOM WERE NUMBERED 11, 12, & 13. SERIAL NUMBERS FOR #11 - 3412518, #12 - 3412513, #13 - 3413725. I ADVISED MR. PUGLEISE OF THE HYDRAULIC OIL CLEANUP PROCEDURES, INCLUDING PROPER STAGING & DISPOSAL METHODS. I TOLD HIM DEC MAY REQUIRE PCB SAMPLING, DEPENDING WHAT INFO. WE GET FROM VIBRATECH. 12/12/97: MNP TELECON TO VIBRATECH. SPOKE W/ PAUL WILSON HE BELEIVED THAT THE PCB'S HAD BEEN TAKEN CARE OF, BUT WASN'T SURE. I TOLD HIM WE HAVE INFO. FROM THE PHASE1 REPORT INDICATED PCB'S IN SOME OF THE TRANSFORMERS, BUT NO DOCUMENTATION IN PHASE 2 NOR REMEDIATION FILES. WILSON SAID HE WILL LOOK FOR DOCUMENTATION, BUT MARIO PUGLEISE IS CURRENT OWNER & RESPONSIBLE FOR ANY PROBLEMS, EXCAEPT FOR ONGOING HAZ-WASTE MONITORING. 01/12/98: MNP TELECON WITH MR.PUGLEISE'S ATTORNEY, STEVEN COHEN. I TOLD HIM THAT MR.PUGLIESE DID NOT CLAIM THE CERTIFIED LETTER WE SENT NOR DID HE RETURN MY PHONE CALLS EITHER. MR.COHEN SAID HE WILL ACCEPT THE LETTER & COMPLY. I ALSO ADVISED HIM ABOUT THE TENTATIVE MEETING WITH ECO RON BOSELA ON WEDNESDAY 1/14/98. MR.COHEN DID NOT KNOW WHETHER HE COULD MAKE IT OR NOT, I GAVE HIM ECO BOSELA'S PHONE NUMBER. 2/03/98: JDC ON SITE W/ BECI INVESTIGATION AND MET W/ MR STEVEN COHEN WHO AUTHORIZED MY COLLECTION OF SAMPLES UNDER THE CURRENT COURT ORDER. COLLECTED SAMPLES FROM N.E. CORNER OF THE COMPLEX, WIPE SAMPLES OF FLOOR, TRANSFORMER ROOM AND CONCRETE PAD. 02/25/98: MNP REVIEWED WST 2/16/98 SAMPLE REPORT, NO PCB'S DETECTED FOR 1 OIL & 2 WIPE SAMPLES COLLECTED ON 2/3/98. 03/09/98: MNP REVIEWED WST PAYMENT PACKAGE FOR $485.00 RECEIVED ON 3/5/98, PAYMENT APPROVED. 6/22/99 FG SITE INSPECTION. MET REVEREND HARRIS ON SITE. ONE 55 GALLON DRUM OF OIL & WATER (MOSTLY WATER) WAS FOUND IN THE BUILDING. REVEREND HARRIS IS IN THE PROCESS OF PURCHASING THE PROPERTY. HE WILL SEND IN A DISPOSAL RECEIPT. 3/2/00 RECD UNCLAIMED LTR TO PROPHET HARRIS BACK. CITY OF BUFFALO REAL PROPERTY INDICATED THAT THE OWNER OF THE PROPERTY IS: WORLD SERIES OF SPORTS NY, INC, C/O LORENZO & COHEN LAW OFFICES, SUITE 1400, STATLER TOWER, BUFFALO, NY 14202. SENT A LTR REQUESTING AN UPDATE ON THE REMEDIATION STATUS TO WORLD SERIES OF SPORTS. A RESPONSE IS DUE ON 3/24/00. 3/21/00 MARIO PUGLIESE CALLED AND REQUESTED THAT WE SEND HIM A COPY OF COMPANIES WHICH ACCEPT WASTE OIL FOR RECYCLING WHICH WE FAXED HIM AT (905)357-6383. 9/18/00 MAURICE MOORE WITH THE NYSDEC, INACTIVE HAZARDOUS WASTE PROGRAM SENT ME A NOTE THAT HE INSPECTED THE SITE ON 9/15/00 AND DISCOVERED OIL IN MW6. HE REFERRED THIS PROBLEM TO THE SPILLS GROUP. 9/21/00 LTRS SENT TO VIBRATECH AND MARIO PUGLIESE REQUESTING THAT THEY EITHER ALLOW NYSDEC TO COMPLETE THE SITE WORK OR DO IT THEMSELVES. A RESPONSE IS DUE 10/6/00. 9/28/00 BRYAN KEYT WITH BELL BOYD & LLOYD CALLED FOR VIBRATECH AND SAID THAT THEY WILL PROVIDE A RESPONSE BY 11/6/00. HIS PHONE NUMBER IS 312-807-4328. 10/2/00 BRYAN KEYT SENT A LETTER STATING THEY WILL PROVIDE A RESPONSE BY 11/6/00. 8/31/01 FG JFO MAURICE MOORE, NATURE'S WAY-RUSS SAVAGE &

VIBRATECH INC. (Continued) **S102176404**

JAMIE HALL SITE VISIT. MARIO PUGLIESE WAS NOT ON SITE BUT THE MAINTENANCE MAN WAS ON SITE AND SAID THAT THE SIDE DOOR WAS OPEN AND WE COULD GO IN. SEVERAL DRUMS WITH OIL WERE FOUND. THE FLOORING WAS ALL PILED UP. IT IS SOAKED WITH OIL. VIBRATECH WILL BE SAMPLING THE WELLS ON 9/6/01. NATURE'S WAY WILL BE ON SITE TO COLLECT SAMPLES AT THE SAME TIME. WATER IN THE BASEMENT HAD OIL ON IT. MR. PUGLIESE CALLED THE OFFICE PER SAL CALANDRA AT 10:15 INDICATING HE COULD NOT MEET US AT THE SITE. 09/06/01 JFO MET WITH DUSTIN STEINER, DAVID TYRAN AND JANE ALL FROM CRA AND RUSS SAVAGE OF NATURE'S WAY. THEY COLLECTED SAMPLES FROM THE 3 WELLS. RUSS GOT A SAMPLE FROM THE 1 WELL WITH THE OIL. HE WILL ANAYLZE FOR 310.13, 8021 AND 8270. RESULTS TO FOLLOW. THERE WAS A LAYER OF PRODUCT IN THE WELL. A SUBSURFACE INVESTIGATION WILL IS NECESSARY. 09/14/01 RCVD ABOVE-NOTED ANALYTICAL RESULTS FOR MW6. THE 310.13 INDICATES LUB OIL 8260 VINYL CHLORIDE 23.1 PPB 1,1-DICHLOROETHANE 99.9 PPB CTS-1,2-DICHLOROETHENE 96.5 PPB TETRACHLOROETHENE 10.8 PPB ALL OTHER COMPOUNDS ON THE 8260 AND ALL ON THE 8270 ARE less than DL 09/24/01: KAB/DALE GRAMZA, NATURE'S WAY/TELECON (1000 HRS) - MR. GRAMZA INDICATED THAT HE WAS AT THE PROPERTY TO DO SOME SAMPLING AND THAT THE LOCK ON THE GATE HAD BEEN CHANGED. ADVISED THAT I WOULD CALL HIM BACK. SPOKE TO JOE HOUSEBECK, DEC ATTY., WHO ADVISED THAT THERE WAS AN AGREEMENT THAT SITE COULD NOT BE ACCESSED UNLESS MR. PUGLIESSI IS PRESENT. KAB CONTACTED DALE GRAMZA AND ADVISED THAT FG IS ON INDEFINITE LEAVE AND THAT, PER OUR ATTORNEY, WORK ON THE PROPERTY SHOULD BE CEASED UNTIL FURTHER NOTICE. 09/24/01: JFO RETURNED TO OFFICE AND ADVISED THAT DALE GRAMZA HAD PAGED HIM AND WANTED TO GAIN ACCESS TO THE SITE. THAT CONVERSATION WAS AT APPROXIMATELY 12:00 P.M., 2 HOURS AFTER MR. GRAMZA HAD BEEN ADVISED THAT HE WAS NOT TO ENTER THE SITE UNTIL FURTHER NOTICE. 10/25/01 JFO REC'D PAYMENT REQUEST FOR WORK DONE 8/31/01 THRU 9/24/01. 687.41. SUBMITTED TO SAC. PJB INFORMED JFO THAT HE HAS RECEIVED A KEY FOR THE FENCE FROM MR PUGLIESE. HE WILL KEEP IT IN HIS DESK DRAWER. 11/16/01 JFO ON SITE MET WITH DALE GRAMZA AND HELPER BOTH OF NATURE'S WAY. THEY WILL DO SOME SOIL BORINGS. JFO BACK ON SITE, THERE IS A CONCRETE SLAB APPROX 4' UNDER THE SLOPE OF THE DOCK. 12/07/01: MF FOR FG, NW SUBMITTED PROPOSAL FOR BEDROCK MW INSTALLATION. LETTER TO NW, NEED MORE DETAIL. RESPONSE BY 1/7/02. 01/18/02 JFO OPENED THE GATE FOR NATURE'S WAY. MET WITH DALE, LUI AND STEVE, ON SITE IS THE DRILL RIG AND A VAN. THEY WILL DRILL 4 ROCK WELLS OUTSIDE AND POSSIBLY 2 INSIDE. THEY WILL ALSO SAMPLE THE DRUM INSIDE AND INSPECT THE BASEMENT. JFO BACK ON SITE MET WITH DALE G LUI AND STEVE. THEY HAVE ONE WELL DRILLED. THEY FOUND ANOTHER DRUM INSIDE. DALE WILL SAMPLE THE DRUMS ON MONDAY (HOLIDAY) AND HE WILL ALSO SAMPLE THE WOOD BLOCKS ON TUESDAY. MAURICE MOORE OF DER SUGGESTS WE COLLECT 5 BLOCKS FROM THE 5 PILES. DALE WILL SAMPLE THE 5 LARGEST PILES (5 BLOCKS WILL BE ONE SAMPLE) ALSO HE WILL SUBMIT A SKETCH OF WHERE EACH PILE IS LOCATED. THERE IS ABOUT 1 1/2 FEET OF WATER IN THE BASEMENT. DALE WILL ENTER AND SEARCH FOR A SHEEN. I WILL RETURN AT 4:00 TO LOCK THE GATE. ALSO THEY INTEND TO WORK ON MLK DAY. I WILL UNLOCK THE GATE FOR THEM AT 7AM. JFO ON SITE AT 4PM. 1 WELL HAS BEEN INSTALLED. 01/21/02 JFO ON SITE TO UNLOCK THE GATE FOR NW. DALE AND STEVE ARRIVED AT 9AM THE DRILL RIG AND THE VAN. THEY WILL SAMPLE THE DRUMS AND INSTALL MORE WELLS. THEY WILL SAMPLE THE WOODEN BLOCKS TOMORROW. JFO BACK ON SITE 2 WELLS HAVE BEEN INSTALLED. I WILL BE BACK ON SITE IN THE MORNING TO UNLOCK THE GATE. 01/22/02 JFO ON SITE MET WITH DALE AND STEVE, ALSO ON SITE ARE THE DRILL RIG AND THE VAN. THEY ARE JUST FINISHING THE WELL INSIDE THE BLDG. DALE AND I SAMPLED THE 5 LARGEST PILES OF WOODEN BLOCKS. THERE IS CONCRETE, ELECTRICAL

VIBRATECH INC. (Continued) **S102176404**

CONDUIT, FIBERGLAS, GLASS AND RAGS IN EACH OF THE PILES. DALE WILL BE ON SITE TOMORROW. I WILL UNLOCK THE GATE TOMORROW MORNING. 01/23/02 JFO ON SITE MET WITH DALE (VAN ALSO ON SITE) HE IS FILLING IN THE AREAS AROUND THE TOP OF THE WELLS WITH CONCRETE. HE DISCOVERED SEVERAL INCHES OF PRODUCT IS TWO OF THE WELLS THIS MORNING. IT IS BELEIVED TO BE #6 OIL. HE WILL CONTACT ME WHEN HE NEEDS ACCESS AGAIN. 02/11/02: MF FOR FG RECEIVED THE RESULTS FROM NW INVESTIGATION: DOH 310-13 RESULTS: MW1-02 - LUBE OIL PRESENT: MW3-02 - ND: EXISTING MW6 - ND: BASEMENT WATER - ND: DRUM WATER - LUBE OIL DETECTED. 8270 RESULTS: MW1-02, MW2-02, MW3-02, MW4-02, MW5-02, EXISTING MW2, EXISTING MW6, EXISTING MW7, DRUM WATER, BASEMENT WATER ALL ND. 8260 RESULTS, IN PPB. JFO, MAURICE & JOE CCED ON THIS. 03/21/02: MF FOR FG CHRIS ZIOLKOWSKI 856-8517 CALLED & SAID HE IS PURCHASING THE PROPERTY. HE IS PURCHASING THE PROPERTY FROM SILENT PARTNER GROUP, LEE CARMEN, 1-800-766-6784. 04/29/02 JFO TO MEET NATURE'S WAY ON SITE TO REMOVE AND DISPOSE THE DRUM OF OILY WATER. 06/07/02: MF RECEIVED A LETTER FROM VIBRATECH INDICATING THEY WILL CONTINUE TO MONITOR. 12/12/02: JAA/FILE. ON 6/24 NATURE'S WAY PROVIDED REPORT ON ADDITIONAL FIELD WORK NEEDED TO COMPLETE SUBSURFACE INVESTIGATION. ON 10/11/02: MLD SPOKE TO JERVIS SLATER ABOUT SITE, 871-1396. HE WAS INTERESTED IN PURCHASING AT AUCTION. MLD INFORMED HIM OF VIBRATECH OBLIGATIONS TO MONITOR, AND REQUIREMENT FOR SPILL INVESTIGATION AND REMEDIATION. 12/24/02 FG SPOKE TO DALE GRAMZA WITH NATURE'S WAY. HE WILL PREPARE A REPORT OF BACKGROUND INFORMATION AND SURVEY THE SITE. A MAP WILL BE GENERATED AND DECISIONS ON ADDITIONAL FIELD WORK WILL BE MADE AFTER THIS. 1/8/03 FG SITE INSPECTION ALONG WITH DALE GRAMZA OF NATURE'S WAY. WE COLLECTED A PRODUCT SAMPLE FROM THE UST ON SITE TO BE ANALYZED FOR DOH 310-13. IT WAS TAKEN FROM 15,000 GALLON FUEL OIL REGISTERED UST FURTHEST NORTH. DALE HAD ALREADY TAKEN A SAMPLE FROM THE OTHER UST ON HIS LAST INSPECTION. THE REASON FOR THE SAMPLES IS TO TRY TO COMPARE PRODUCT WITH THE OIL FOUND IN THE WELLS THAT HAD BEEN INSTALLED IN BEDROCK BY NATURE'S WAY. DALE GRAMZA'S LAST INSPECTION REVEALED THAT TWO FEET OF PRODUCT IS PRESENT IN THESE WELLS. MR. GRAMZA BELIEVES THAT THE SOURCE MAY BE THESE UST'S. MET DAN TREDO ON SITE. HE IS PLACING JUNK VEHICLES IN THE BUILDING AND MAY BE DUMPING FLUIDS. ADDITIONAL BEDROCK WELLS WILL BE INSTALLED NEXT WEEK TO DETERMINE THE SOURCE OF THE NEWLY DISCOVERED PRODUCT IN THE WELLS. THIS WILL BE DONE ONCE THE OWNERS ARE CONTACTED. 01/20/03 JFO ON SITE MET WITH DALE G OF NATURE'S WAY. THEY ARE AT APPROX 8' ON THE FIRST WELL. NO PRODUCT YET. 01/23/03 JFO CALL FROM DALE GRAMZA OF NATURE'S WAY. THEY WILL NOT BE ON SITE TODAY OR TOMORROW. HE SAID WORK WILL RESUME ON MONDAY JAN 27. 1/28/03 FG SITE INSPECTION. NATURE'S WAY ON SITE CONTINUING BEDROCK WELLS. SO FAR, 5 WELLS HAVE BEEN INSTALLED. 4 OF THE WELLS SHOWED SIGNS OF PETROLEUM ON THE BEDROCK. ADDITIONAL WELLS WILL BE INSTALLED TO DETERMINE THE EXTENT OF THE CONTAMINATION. 2/4/03 RECD THE RESULTS FROM THE SAMPLE COLLECTED FROM THE OTHER UST ON SITE. THE RESULTS SHOW THAT FUEL OIL #2 IS PRESENT. 2/4/03 MARIO PUGLIESE REQUESTED THAT THIS OFFICE FAX HIM THE MOST RECENT LETTERS THAT WERE SENT TO HIM. THIS WAS DONE. 4/9/03 RECD GROUNDWATER SAMPLING RESULTS. MW1 SHOWED ND. MW4 SHOWED THAT LUBRICATING OIL IS PRESENT. MW8 SHOWED THAT LUBICATING OIL IS ALSO PRESENT. 4/24/03 RECD ANALYTICAL RESULTS FROM UST SAMPLES FOR PCB'S. NO PCB'S WERE DETECTED. 5/6/03 RECD ANALYTICAL RESULTS FROM LSL FOR MW1 - 8270, 8260 AND DOH310-13 ALL ND. MW4 -LUBRICATING OIL PRESENT. MW8 LUBRICATING OIL PRESENT. 11/21/03 RECD NATURE'S WAY REPORT OF FINDINGS. SUBMITTED A COPY TO VIBRATECH AND MARIO PUGLIESE REQUESTING REMEDIATION WITH A RESPONSE DUE BY 12/17/03. 1/20/04 FG SPOKE TO MARIO PUGLIESE, OWNER OF PROPERTY. HE RECEIVED OUR LETTERS AND IS RESPONDING BY THIS CALL. HE DOES NOT FEEL HE IS RESPONSIBLE FOR THE WORK THAT IS NECESSARY ON SITE AND WILL NOT SPEND ANY ADDITIONAL MONEY ON CLEANUP BECAUSE HE DOESN'T HAVE IT. HE REQUESTED THE NAME AND NUMBER OF VIBRATECH AND WILL CALL THEM. HE SAID HE HAD AN AGREEMENT WITH THEM PRIOR TO HIS PURCHASE OF THE PROPERTY. 1/20/04 FG

VIBRATECH INC. (Continued) **S102176404**

CALLED VIBRATECH AT 937-6600. THE NUMBER WAS TRANSFERRED TO HORSCHEL BROS IN SPRINGVILLE. THEY SAID THAT VIBRATECH IS IN BANKRUPTCY AND THE ATTORNEY FOR THE BANKRUPTCY IS RING. HE SAID VIBRATECH IS LIQUIDATED. 2/13/04 LETTER SENT TO MARIO PUGLIESE REQUESTING SITE ACCESS BECAUSE VIBRATECH IS BANKRUPT. RESPONSE IS DUE 3/16/04. 4/2/04 RECD ESTIMATE FOR UST REMOVAL FROM NATURE'S WAY AND FAXED TO MARIO PUGLIESI AT 519-686-0176. HE SAID HE WOULD CALL BACK. 4/13/04 FG SPOKE TO MARIO PUGLIESE WHO SAID THAT HE RECEIVED THE FAX OF THE COST ESTIMATE FOR THE UST REMOVALS AND HAS FORWARDED IT TO HIS CONTRACTOR. HE HAS NOT HEARD BACK FROM HIS CONTRACTOR WITH A PRICE. HE WILL NOTIFY THIS OFFICE BY THE END OF THIS WEEK,4/16/04 WHETHER OR NOT HE WILL COMPLETE THE WORK OR ALLOW NYSDEC TO COMPLETE THE WORK. 4/22/04 FG SPOKE TO MARIO PUGLIESE, 905-932-4412 WHO SAID THAT HE WILL GET BACK TO ME BY 4/30/04 WITH A COMMITTMENT FROM HIS CONTRACTOR, DNL CONSTRUCTION, FROM PA AS TO WHEN THEY WILL COMPLETE THE UST REMOVAL. 6/23/04 RECD A RESPONSE TO AN RP LETTER TO IDEX. THEY INDICATE THEY ARE NOT RESPONSIBLE. THEY STATE THEY MERELY OWNED STOCK IN VIBRATECH. 7/15/04 MR. PUGLIESE HAS NOT RESPONDED TO LEGAL'S REQUEST FOR ACTION ON THE PBS/UST ISSUE. LEGAL HAS REQUESTED THAT I WAIT FOR THAT ACTION TO BE RESOLVED BEFORE I PROCEED WITH ANYTHING ON THE SPILLS SIDE. 6/9/05 SPILL SITE REFERRED TO THE LONG TERM REMEDIATION GROUP. SPILL SITE IS CLOSED. SPILL FILE GIVEN TO LONG TERM. 06/17/06 (CRS) Marty Doster and myself met on-site with Kevin Mathies and Joe Consentino (both with EPA). EPA was completing a walk through of the building to determine if hazardous materials may exists within the building. Joe Consentino outlined the following potential issues in a follow-up e-mail: On site observations indicate a need to conduct a comprehensive sampling investigation to confirm or dispel the presence of hazardous waste and/or hazardous substances at the site. Substances believed present include; mercury (switches, bulbs and vapor lamps), asbestos (pipe and boiler wrap), petroleum hydrocarbons, oils and greases, PCB ballast on old fluorescent lights and possible peeling lead paint. Several drums(55 gallon) and smaller containers were located throughout the site buildings will require sampling. In addition, wooden block floors, sumps and drains appear heavily contaminated and need to be investigated. 06/08/06 RMC/FILE. SITE ACTIVE UNDER CHAD STANISZEWSKI. 06/08/06 (CRS) Unrestricted site access granted by Mario Pugliese's attorney, Steven Cohen, in a letter to the AG dated May 7, 2006. DEC received notification that access was granted in a letter from the AG's office dated May 22, 2006. 06/15/06 (CRS) Cut existing EPA chains on two access gates and placed a new lock on the chains (in addition to the EPA locks which already existed). DEC now has access to the site via two gates: the eastern most gate on E. Delevan and the eastern most gate on Northland Drive. 06/19/06 (CRS) Met on-site with Gary House and Brian Hutzler of OpTech Environmental Services to access removal of the two fuel oil tanks on the east side of the building. Approximately 2-3 feet of product in each tank. Bottom of tanks appear to be approximately 10-12 feet below ground. Also, informed Op-Tech that we would like product removed from all existing wells that currently contain product ((6) wells total MW6, MW1-02, MW3-02, MW4-02, MW5-02 and MW8-03). OpTech indicated they should be able to mobilize in a couple of weeks. 08/04/06 - 08/10/06 (CRS) Optech on-site to clean the two underground No. 6 fuel oil tanks. The fuel oil in each tank was removed with a vac. truck (the oil in the southern tank was heated with a boiler/enclosed steam pipe for (3) days to thin the oil prior to removal). The tanks were swept with No. 2 fuel oil to remove

VIBRATECH INC. (Continued) **S102176404**

residual oil on the tank walls, pressure washed and wiped with adsorbent pads. The tanks were cleaned in place. The northern tank was excavated and removed from the ground. The sand bedding around the tank was generally not visually impacted, however, when the bedding material was removed from the excavation, oil began seeping out of the bedrock. It is not believed that the oil seeping from the bedrock originated from the north tank. The tank was in good condition with no holes observed. Additional investigation is necessary. Testing on the oil leaking from the bedrock identified the oil as #6 fuel. The southern tank was not removed due to its proximity to a smoke stack. Optech was concerned that removal of the tank may undermine the stability of the stack. The south tank was left in place, empty. 02/14/14 (CRS) Site continues to be investigated under the Superfund program to address historic TCE contamination. Additional spills investigation of on-site oil anticipated following Superfund work. 6/9/16 NO FURTHER WORK WILL TAKE PLACE UNDER THIS SPILL. ALL WORK IS BEING CONDUCTED UNDER THE HAZARDOUS WASTE SITE 915165. ALL FOLLOWUP WILL BE UNDER THAT SITE NUMBER. THIS SPILL IS CLOSED WITH NO FURTHER WORK REQUIRE.

DEC Memo:	SMALL DRIP, WILL REPLACE TRANSFORMER, NOT LEAKING NOW.
Remarks:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was MF 10/06/88: MF TELECON WILLIAM LEES, NOT IN, LEFT MESSAGE TO CALL ME. (0820). 10/06/88: MF BILL LEES TELECON, HE CLAIMED BUFFALO ELECTRIC HIRED TO CHANGE TX, & ENSCO ENVIRONMENTAL HIRED TO CLEAN AREA AND DISPOSE OF TX'S. TX CONTAIN 500K PPM PCB'S. TX NOT LEAKING NOW. 12/02/88: MF TELECON WALT GASIOR (VIBRATECK), HE CLAIMED BUFFALO ELECTRIC TO START JOB POSSIBLY MONDAY 12/5/88. HE WILL CALL WHEN DATE FIRM. 01/17/89: MF TELECON WALT GASIOR, HE CLAIMED BUFFALO ELECTRIC DISCONNECTED TRANSFORMERS. HE IS NOW WAITING FOR EMSCO TO DISPOSE OF SAME. HE WILL SEND RECEIPTS. 02/06/89: MF RECIIVED COPY OF DISPOSAL RECEIPT, NO FUTHER ACTION NECESSARY.

Hazardous Waste Summary:

Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	D002
Waste Description:	Corrosive Waste
Waste Code:	D006
Waste Description:	Cadmium
Waste Code:	D008
Waste Description:	Lead
Waste Code:	D009
Waste Description:	Mercury
Waste Code:	D018
Waste Description:	Benzene
Waste Code:	D019
Waste Description:	Carbon Tetrachloride
Waste Code:	D021
Waste Description:	Chlorobenzene
Waste Code:	D022
Waste Description:	Chloroform
Waste Code:	D023
Waste Description:	O-Cresol
Waste Code:	D024
Waste Description:	M-Cresol
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

USEPA - REGION II - VIBRATECH SITE (Continued) **1000353834**

Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F005
Waste Description:	The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F006
Waste Description:	Wastewater Treatment Sludges From Electroplating Operations, Except From The Following Processes: (1) Sulfuric Acid Anodizing Of Aluminum; (2) Tin Plating On Carbon Steel; (3) Zinc Plating (Segregated Basis) On Carbon Steel; (4) Aluminum Or Zinc-Aluminum Plating On Carbon Steel; (5) Cleaning/Stripping Associated With Tin, Zinc, And Aluminum Plating On Carbon Steel; And (6) Chemical Etching And Milling Of Aluminum.
Waste Code:	F007
Waste Description:	Spent Cyanide Plating Bath Solutions From Electroplating Operations.
Waste Code:	F008
Waste Description:	Plating Bath Residues From The Bottom Of Plating Baths From Electroplating Operations In Which Cyanides Are Used In The Process.
Waste Code:	F009
Waste Description:	Spent Stripping And Cleaning Bath Solutions From Electroplating Operations In Which Cyanides Are Used In The Process.
Waste Code:	F017
Waste Description:	Not Defined
Waste Code:	U002
Waste Description:	2-Propanone (I) (Or) Acetone (I)
Waste Code:	U080
Waste Description:	Methane, Dichloro- (Or) Methylene Chloride
Waste Code:	U159
Waste Description:	2-Butanone (I,T) (Or) Methyl Ethyl Ketone (Mek) (I,T)
Waste Code:	U160
Waste Description:	2-Butanone, Peroxide (R,T) (Or) Methyl Ethyl Ketone Peroxide (R,T)
Waste Code:	U161

USEPA - REGION II - VIBRATECH SITE (Continued) **1000353834**

Waste Description: 4-Methyl-2-Pentanone (I) (Or) Methyl Isobutyl Ketone (I) (Or) Pentanol, 4-Methyl-

Waste Code: U162
Waste Description: 2-Propenoic Acid, 2-Methyl-, Methyl Ester (I,T) (Or) Methyl Methacrylate (I,T)

Waste Code: U210
Waste Description: Ethene, Tetrachloro- (Or) Tetrachloroethylene

Waste Code: U226
Waste Description: Ethane, 1,1,1-Trichloro- (Or) Methyl Chloroform

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)

USEPA - REGION II - VIBRATECH SITE (Continued) **1000353834**

Violation Short Description:	Not reported
Date Violation was Determined:	Not reported
Actual Return to Compliance Date:	Not reported
Return to Compliance Qualifier:	Not reported
Violation Responsible Agency:	Not reported
Scheduled Compliance Date:	Not reported
Enforcement Identifier:	Not reported
Date of Enforcement Action:	Not reported
Enforcement Responsible Agency:	Not reported
Enforcement Docket Number:	Not reported
Enforcement Attorney:	Not reported
Corrective Action Component:	Not reported
Appeal Initiated Date:	Not reported
Appeal Resolution Date:	Not reported
Disposition Status Date:	Not reported
Disposition Status:	Not reported
Disposition Status Description:	Not reported
Consent/Final Order Sequence Number:	Not reported
Consent/Final Order Respondent Name:	Not reported
Consent/Final Order Lead Agency:	Not reported
Enforcement Type:	Not reported
Enforcement Responsible Person:	Not reported
Enforcement Responsible Sub-Organization:	Not reported
SEP Sequence Number:	Not reported
SEP Expenditure Amount:	Not reported
SEP Scheduled Completion Date:	Not reported
SEP Actual Date:	Not reported
SEP Defaulted Date:	Not reported
SEP Type:	Not reported
SEP Type Description:	Not reported
Proposed Amount:	Not reported
Final Monetary Amount:	Not reported
Paid Amount:	Not reported
Final Count:	Not reported
Final Amount:	Not reported

Evaluation Action Summary:

Evaluation Date:	19870717
Evaluation Responsible Agency:	State
Found Violation:	No
Evaluation Type Description:	COMPLIANCE EVALUATION INSPECTION
Evaluation Responsible Person Identifier:	NYDEC
Evaluation Responsible Sub-Organization:	Not reported
Actual Return to Compliance Date:	Not reported
Scheduled Compliance Date:	Not reported
Date of Request:	Not reported
Date Response Received:	Not reported
Request Agency:	Not reported
Former Citation:	Not reported

Evaluation Date:	20010530
Evaluation Responsible Agency:	State
Found Violation:	No
Evaluation Type Description:	COMPLIANCE EVALUATION INSPECTION
Evaluation Responsible Person Identifier:	NYRWK
Evaluation Responsible Sub-Organization:	R9
Actual Return to Compliance Date:	Not reported

Click Here for FRS Facility Detail Report:

Environmental Interest/Information System:
THE EMISSION INVENTORY SYSTEM (EIS) MAINTAINS AN INVENTORY OF LARGE STATIONARY SOURCES AND VOLUNTARILY-REPORTED SMALLER SOURCES OF AIR POINT POLLUTANT EMITTERS. IT CONTAINS INFORMATION ABOUT FACILITY SITES AND THEIR PHYSICAL LOCATION, EMISSIONS UNITS, EMISSIONS PROCESSES, RELEASE POINTS, CONTROL APPROACHES, AND REGULATIONS. FACILITY INVENTORY DATA ARE KEPT SEPARATE FROM THE EMISSIONS DATA AND HAVE STABLE IDENTIFIERS TO IMPROVE CONTINUITY FROM YEAR TO YEAR AND TO HELP IDENTIFY DUPLICATE OR MISSING FACILITIES
The Air Facility System (AFS) contains compliance and permit data for stationary sources of air pollution regulated by the EPA, state, and local air pollution agencies.
ICIS-Air (AIR) AIR is the modernization of the Air Facility System (AFS) into the Integrated Compliance Information System (ICIS). AIR

BUFLOVAK LLC (Continued) **1016099182**

contains enforcement, compliance, and permit data for stationary sources of air pollution regulated by the EPA, State, and Local air pollution agencies.
The New York Department of Environmental Conservation Facility Information System (FIS) database houses all information about facilities that are regulated or of environmental interest to the state of New York.
The Toxic Release Inventory System (TRIS) is a publicly available EPA database reported annually by certain covered industry groups, as well as federal facilities. It contains information about more than 650 toxic chemicals that are being used, manufactured, treated, transported, or released into the environment, and includes information about waste management and pollution prevention activities.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.
The National Pollutant Discharge Elimination System (NPDES) module of the Integrated Compliance Information System (ICIS). Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.

Hazardous Waste Summary:

Waste Code:	D000
Waste Description:	Not Defined
Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	D002
Waste Description:	Corrosive Waste
Waste Code:	D003
Waste Description:	Reactive Waste
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F002
Waste Description:	The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F003
Waste Description:	The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent

HEBELER PROCESS SOLUTIONS LLC (Continued) **1000434821**

Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F004
Waste Description: The Following Spent Nonhalogenated Solvents: Cresols, Cresylic Acid, And Nitrobenzene; And The Still Bottoms From The Recovery Of These Solvents; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F006
Waste Description: Wastewater Treatment Sludges From Electroplating Operations, Except From The Following Processes: (1) Sulfuric Acid Anodizing Of Aluminum; (2) Tin Plating On Carbon Steel; (3) Zinc Plating (Segregated Basis) On Carbon Steel; (4) Aluminum Or Zinc-Aluminum Plating On Carbon Steel; (5) Cleaning/Stripping Associated With Tin, Zinc, And Aluminum Plating On Carbon Steel; And (6) Chemical Etching And Milling Of Aluminum.

Waste Code: F007
Waste Description: Spent Cyanide Plating Bath Solutions From Electroplating Operations.

Waste Code: F008
Waste Description: Plating Bath Residues From The Bottom Of Plating Baths From Electroplating Operations In Which Cyanides Are Used In The Process.

Waste Code: F009
Waste Description: Spent Stripping And Cleaning Bath Solutions From Electroplating Operations In Which Cyanides Are Used In The Process.

Waste Code: F010
Waste Description: Quenching Bath Residues From Oil Baths From Metal Heat Treating Operations In Which Cyanides Are Used In The Process.

Waste Code: F014
Waste Description: Not Defined

Waste Code: K011
Waste Description: Bottom Stream From The Wastewater Stripper In The Production Of Acrylonitrile.

HEBELER PROCESS SOLUTIONS LLC (Continued) **1000434821**

Waste Code: K014
Waste Description: Bottoms From The Acetonitrile Purification Column In The Production Of Acrylonitrile.

Waste Code: K016
Waste Description: Heavy Ends Or Distillation Residues From The Production Of Carbon Tetrachloride.

Waste Code: K018
Waste Description: Heavy Ends From The Fractionation Column In Ethyl Chloride Production.

Waste Code: K019
Waste Description: Heavy Ends From The Distillation Of Ethylene Dichloride In Ethylene Dichloride Production.

Waste Code: K020
Waste Description: Heavy Ends From The Distillation Of Vinyl Chloride In Vinyl Chloride Monomer Production.

Waste Code: K023
Waste Description: Distillation Light Ends From The Production Of Phthalic Anhydride From Naphthalene.

Waste Code: K024
Waste Description: Distillation Bottoms From The Production Of Phthalic Anhydride From Naphthalene.

Waste Code: K036
Waste Description: Still Bottoms From Toluene Reclamation Distillation In The Production Of Disulfoton.

Waste Code: K037
Waste Description: Wastewater Treatment Sludges From The Production Of Disulfoton.

Waste Code: K038
Waste Description: Wastewater From The Washing And Stripping Of Phorate Production.

Waste Code: K045
Waste Description: Spent Carbon From The Treatment Of Wastewater Containing Explosives.

Waste Code: K046
Waste Description: Wastewater Treatment Sludges From The Manufacturing, Formulation, And Loading Of Lead-Based Initiating Compounds.

Waste Code: K047
Waste Description: Pink/Red Water From Tnt Operations.

Waste Code: K062
Waste Description: Spent Pickle Liquor From Steel Finishing Operations Of Plants That Produce Iron Or Steel.

Waste Code: P005
Waste Description: 2-Propen-1-Ol (Or) Allyl Alcohol

Waste Code: P012
Waste Description: Arsenic Oxide As2o3 (Or) Arsenic Trioxide

HEBELER PROCESS SOLUTIONS LLC (Continued) **1000434821**

Waste Code:	P022
Waste Description:	Carbon Disulfide
Waste Code:	P030
Waste Description:	Cyanides (Soluble Cyanide Salts), Not Otherwise Specified
Waste Code:	P043
Waste Description:	Diisopropylfluorophosphate (Dfp) (Or) Phosphorofluoridic Acid, Bis(1-Methylethyl) Ester
Waste Code:	P059
Waste Description:	4,7-Methano-1h-Indene, 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-Tetrahydro- (Or) Heptachlor
Waste Code:	P074
Waste Description:	Nickel Cyanide (Or) Nickel Cyanide Ni(Cn)2
Waste Code:	P076
Waste Description:	Nitric Oxide (Or) Nitrogen Oxide No
Waste Code:	P098
Waste Description:	Potassium Cyanide (Or) Potassium Cyanide K(Cn)
Waste Code:	U001
Waste Description:	Acetaldehyde (I) (Or) Ethanal (I)
Waste Code:	U019
Waste Description:	Benzene (I,T)
Waste Code:	U061
Waste Description:	Benzene, 1,1'-(2,2,2-Trichloroethylidene)Bis[4-Chloro- (Or) Ddt
Waste Code:	U112
Waste Description:	Acetic Acid, Ethyl Ester (I) (Or) Ethyl Acetate (I)
Waste Code:	U122
Waste Description:	Formaldehyde
Waste Code:	U123
Waste Description:	Formic Acid (C,T)
Waste Code:	U134
Waste Description:	Hydrofluoric Acid (C,T) (Or) Hydrogen Fluoride (C,T)
Waste Code:	U140
Waste Description:	1-Propanol, 2-Methyl- (I,T) (Or) Isobutyl Alcohol (I,T)
Waste Code:	U147
Waste Description:	2,5-Furandione (Or) Maleic Anhydride
Waste Code:	U154
Waste Description:	Methanol (I) (Or) Methyl Alcohol (I)
Waste Code:	U159
Waste Description:	2-Butanone (I,T) (Or) Methyl Ethyl Ketone (Mek) (I,T)
Waste Code:	U161

HEBELER PROCESS SOLUTIONS LLC (Continued) **1000434821**

Waste Description: 4-Methyl-2-Pentanone (I) (Or) Methyl Isobutyl Ketone (I) (Or) Pentanol, 4-Methyl-

Waste Code: U201
Waste Description: 1,3-Benzenediol (Or) Resorcinol

Waste Code: U211
Waste Description: Carbon Tetrachloride (Or) Methane, Tetrachloro-

Waste Code: U220
Waste Description: Benzene, Methyl- (Or) Toluene

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)

Town:	Buffalo (c)
Record Added Date:	12/07/2022
Record Updated Date:	06/29/2023
Update By:	AECAPRIO
Site Description:	Site Location: The 14.53-acre Buffalo Foundry & Machine Park of Innovation site is located at 750 East Ferry Street in the City of Buffalo, Erie County. It is near the intersection of Fillmore Avenue and East Ferry Street and approximately 3 miles south of Erie County Medical Center (ECMC). Site Features: The main site features include several abandoned industrial buildings of varying sizes estimated to be built between 1902 and 1920. Asphalt surfaces exist to the east of the buildings and there are approximately three acres of grassy and/or unpaved areas to the west and east of the buildings. A portion of Scajaquada Creek runs below ground from east to west beneath the main buildings in a concrete tunnel known as the Scajaquada Creek Drain. Current Zoning and Land Use: The municipal zoning designation for the site is D-IH (Heavy Industrial). The surrounding parcels are used for a combination of heavy and light industrial, commercial, residential, and utility/rail corridors. The nearest residential areas are 80 ft to the south along Winchester Avenue and immediately across Fillmore Avenue to the west. Portions of the former manufacturing buildings are leased to third parties for the storage of various supplies/products/equipment. One of the smaller buildings is currently used as a laboratory for Buflovak. A portion of the largest building is used by Habitat for Humanity to assemble

HEBELER PROCESS SOLUTIONS LLC (Continued) **1000434821**

	pre-engineered modular homes. Past Use of Site: The site has been used for manufacturing since before 1900. The Buffalo Foundry & Machine Co. (BF&MC) dates back to 1845, and began manufacturing a product line of steam hammers, impregnators, and vacuum dryers. Over time the company grew to specialize in the production of industrial evaporators used in the food and chemical industry. In 1945, BF&MC was sold to Blaw Knox Food and Chemical Equipment, which operated it as the Buflovak division. Over the next 50 years of continuous operation, the company went through at least seven different ownership groups until being purchased by Hebeler Group in 2016. It has been historically reported that some of the northern portion of the site was used as a city dump. It is also known from historical topographic maps that a portion of Scajaquada Creek was an open channel before the site was developed. The type and quality of material used to fill the former channel is unknown. Site Geology and Hydrogeology: The property is situated on fill material over clayey silts on Onondaga Limestone bedrock. Sand and gravel have also been observed from soil borings and are thought to be associated with the buried Scajaquada Creek. Fill consists primarily of black ash, cinders, and foundry sands, with trace slag, coal, brick, and iron filings. Groundwater was encountered in site borings and is considered to be influenced by the Scajaquada Creek Drain, which was constructed by the City of Buffalo and consists of brick and concrete. Groundwater flow is directed from east to west by Scajaquada Creek Drain and the estimated dimensions are 33-feet in width by 15-feet in height. The drain is set in bedrock at approximately 11-feet below ground surface. Groundwater flow outside of the Scajaquada Creek Drain influence is expected to be to the west.
	Not reported
Env Problem:	Based on the information included in the BCP application, the primary contaminants of concern are polycyclic aromatic hydrocarbons (PAHs) in soil. A full remedial investigation is needed to characterize the nature and extent of contamination.
Health Problem:	Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

Tank Info:

Tank Number: 1
Tank Id: 167859
Material Code: 0001
Common Name of Substance: #2 Fuel Oil (On-Site Consumption)

Equipment Records:

H99 - Tank Leak Detection - Other
A00 - Tank Internal Protection - None
D01 - Pipe Type - Steel/Carbon Steel/Iron
B00 - Tank External Protection - None
C00 - Pipe Location - No Piping
F00 - Pipe External Protection - None
I04 - Overfill - Product Level Gauge (A/G)
J02 - Dispenser - Suction Dispenser
G00 - Tank Secondary Containment - None

Tank Location: Aboveground - on saddles, legs, racks, etc.... Tank bottom is elevated above grade or tank pad, allowing visual inspection.
Tank Type: Steel/Carbon Steel/Iron

Environmental Interest/Information System:
The New York Department of Environmental Conservation Facility Information System (FIS) database houses all information about facilities that are regulated or of environmental interest to the state of New York.
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DER Facility ID:	220831
DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was FG 11/10/00: FG TELECON TO ANDY KUSCERIK. HE SAID HE WILL COMPLETE THE TANK PULLS WITHIN THE NEXT COUPLE OF WEEKS. HE WILL CONTACT THIS OFFICE WHEN HE STARTS WORK. 12/07/00: FG SITE INSPECTION. TWO USTS REMOVED. A 1000 GALLON FUEL OIL AND A 6000 GALLON GASOLINE. ANDY KUSCERIK ON SITE. BOTH USTS WERE STAGED ON SITE. THEY WILL BE CUT OPEN AND CLEANED OUT TOMORROW. THE UST EXCAVATION FOR THE 6K TANK IS APPROXIMATELY 12 FT DEEP AT WHICH THE TOP OF ROCK WAS REACHED. THERE IS NO WATER IN THE EXCAVATION. FOUR SIDEWALL SAMPLES WILL BE COLLECTED. THERE ARE TWO SEPARATE SOIL PILES ON SITE, ONE NEAR EACH

VACANT WAREHOUSE TANKS (Continued) **S104877184**

Remarks: UST. 01/10/01: FG RECEIVED CLOSURE REPORT FROM BARRON & ASSOC. ALL EXCAVATION SAMPLES ARE BELOW STARS. THE SOIL DISPOSAL RECEIPT WAS INCLUDED. 6000 GALLONS OF WATER WAS DISPOSED BUT THE RECEIPT WAS NOT INCLUDED. ANDY KUCSERIK SAID THAT HE WILL SUBMIT THIS RECEIPT. 01/18/01: FG RECEIVED THE DISPOSAL RECEIPT FOR THE WATERS THAT WERE DISPOSED. NO FURTHER WORK IS REQUIRED. THE SITE CAN BE CLOSED. WHILE PHASE II INVESTIGATION ABANDONED TANKS AND GASOLINE CONTAMINATED SOIL WAS FOUND.

Tank Info:

Tank Number:	24353
Tank Id:	168663
Material Code:	0001
Common Name of Substance:	#2 Fuel Oil (On-Site Consumption)

Equipment Records:

B05 - Tank External Protection - Jacketed
C01 - Pipe Location - Aboveground
I04 - Overfill - Product Level Gauge (A/G)
G01 - Tank Secondary Containment - Diking (Aboveground)
H06 - Tank Leak Detection - Impervious Barrier/Concrete Pad (A/G)
A00 - Tank Internal Protection - None

INDECK-YERKES ENERGY CENTER (Continued) **1001357424**

B01 - Tank External Protection - Painted/Asphalt Coating
D01 - Pipe Type - Steel/Carbon Steel/Iron
F01 - Pipe External Protection - Painted/Asphalt Coating
L99 - Piping Leak Detection - Other
E00 - Piping Secondary Containment - None
I02 - Overfill - High Level Alarm
K01 - Spill Prevention - Catch Basin
H02 - Tank Leak Detection - Interstitial - Manual Monitoring
J02 - Dispenser - Suction Dispenser

Tank Location:	Aboveground - contact with impervious barrier... Tank bottom rests on impervious barrier, allowing visual indication of leaks.
Tank Type:	Steel/Carbon Steel/Iron
Tank Status:	In Service
Pipe Model:	Not reported
Install Date:	08/01/1989
Capacity Gallons:	150000
Tightness Test Method:	-
Date Test:	Not reported
Next Test Date:	Not reported
Date Tank Closed:	Not reported
Register:	True
Modified By:	MJGRIFFI

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was FG 3/3/97 REQUESTED THAT ANGELA DEMERLE SEND A COPY OF THE PHASE II ASSESSMENT. SHE AGREED AND SAID THAT THE OWNER IS LOOKING FOR BIDS TO COMPLETE THE REMOVAL OF 2 UST'S & ASSOCIATED CONTAMINATION. 3/11/97 SPOKE TO CRAIG SLATER. REQUESTED A COPY OF THE PHASE II AGAIN. HE SAID HE WILL PUT IT IN THE MAIL TOMORROW. HE WAS UNSURE AS TO WHO THE OWNER OF THE PROPERTY WAS. HE SAID TO SEND LETTERS TO CAMAIR. 3/12/97 SPOKE TO M. ARNO. HE SAID THAT 757 E FERRY INC. OWNS THE PROPERTY AND HE IS THE PRESIDENT OF THAT COMPANY. HE IS HIRING HORIZON ENVRL TO REMOVE UST'S. HE SAID THEY HAVE ALREADY UNCOVERED THE UST'S AND WILL DISPOSE OF THE WATERS AT THE BSA. HE HAS ALREADY OBTAINED A PERMIT FROM BSA FOR THIS ACTIVITY. HE WILL COLLECT SAMPLES FROM THE EXCAVATION FOR ANALYSIS. 3/12/97 LETTER SENT REQUESTING SITE CLEANUP & UST REMOVAL AS WELL AS EXCAVATION SAMPLE COLLECTION. RESPONSE DUE 4/4/97 3/19/97 RECEIVED PHASE II REPORT FOR THE SITE. TANK WATERS ARE ABOVE STARS. 3/24/97 SITE VISIT. MET MICHAEL ARNO. HE SHOWED ME LOCATION OF USTS ON SITE. HE IS WAITING FOR BSA TO APPROVE THE DISCHARGE OF THE WATERS TO THE SEWER. HE EXPECTS TO START WORK IN APPROX 2 WEEKS. 4/8/97 MR. ARNO CALLED STATING THAT WORK IS TO BEGIN SOME TIME THIS WEEK. HE WILL LET ME KNOW WHEN THEY START. HE JUST RECEIVED APPROVAL TO DISCHARGE TO BSA. 4/21/97 MR. ARNO SAID THAT HE WILL DISCHARGE WATER IN USTS AT 9GPM PER THE BSA PERMIT. HE HAS 40,000 GAL OF WATER TO DISCHARGE. HE WILL REMOVE UST'S BY 4/30/97 AND WILL CONTACT ME WHEN HE DOES. 6/6/97 SPOKE TO MIKE ARNO WHO SAID HIS PUMP BROKE SO HE HAS NOT COMPLETED REMOVING WATERS FROM THE UST. HE WILL HAVE THE PUMP REPAIRED AND START WORK BY MONDAY 6/9/97. I TOLD HIM TO CALL AND LET ME KNOW. HE AGREED. 07/01/97: MNP TELECON WITH MIKE ARNO. HE CONFIRMED TANK PULL WAS SCHEDULED FOR 7/9/97, BUT HE ASKED IF TANKS COULD BE FILLED WITH CONCRETE. I SAID OK PROVIDING THE TANKS ARE CLEANED OUT & NO CONTAMINATION PRESENT. SAMPLING UNDER & AROUND THE TANK MUST BE DONE TO CONFIRM NO CONTAMINATION. HE MUST CALL BEFORE PROCEEDING WITH TANK CLOSURE FOR DEC INSPECTION. 7/1/97 JFO SITE VISIT. FOUND CONTAMINATION WHILE UNCOVERING THE TOP OF THE UST'S. SOIL STOCKPILED ON SITE. ADDITIONAL SOIL TO BE REMOVED. UST REMOVAL TO TAKE PLACE ON 7/9/97. 07/09/97: MNP TELECON WITH MR. ARNO. TANK PULL CANCELLED FOR THIS WEEK. I ASKED HIM TO CONTACT FRANCINE GALLEGO WITH NEW DATE. 7/14/97 PHIL BADAME WITH HORIZON CALLED & SAID THAT ANALYTICAL IS BELOW STARS FOR THE EXCAVATION SAMPLES AS WELL AS THE CONTAMINATED SOIL SAMPLES. HE SAID THAT THE UST'S WON'T BE REMOVED AND THE SAMPLES ARE FROM AROUND THE BOTTOM AND ALONG THE SIDES BUT A HOLE WAS NOT CUT THROUGH THE BOTTOM OF THE UST. MR. BADAME SAID HE GOT APPROVAL FOR THIS FROM SOMEONE ELSE IN THIS OFFICE BUT HE DID NOT SAY WHO. HIS INFORMATION ON WHAT WAS TO BE USED IN THE TANKS FOR FILL WAS CONFUSING. I TOLD HIM TO PROVIDE DATA. HE SAID THAT HE MAY START BACKFILLING TODAY. SITE VISIT. EXCAVATION STILL OPEN. USTS HAD BEEN CUT OPEN. NO ONE ON SITE. CALLED MR. BADAME & LEFT A MESSAGE FOR HIM TO RETURN CALL TO CLARIFY ISSUES. 8/21/97 ALL RESULTS SUBMITTED AND SHOW THAT LEVELS ARE BELOW STARS FOR THE SOIL

SECONDARY SERVICES INC (Continued) **1001222861**

Remarks:	PILE AND THE EXCAVATION. THE TANKS WERE CLOSED IN PLACE AND BACKFILLED. NO FURTHER WORK REQUIRED. SITE CAN BE CLOSED. CONTAMINATION AND 2 UST'S (20K) DISCOVERED DURING PHASE II INVESTIGATION

SECONDARY SERVICES INC (Continued) **1001222861**

Remarks: Prior to Sept, 2004 data translation this spill Lead_DEC Field was FG
7/21/97 SITE VISIT. FOUND ROOF DRAINS WHICH LEAD OUT TO THE FRONT OF THE BLDG. NO WHITE MATERIAL DISCHARGING AT THE TIME OF MY VISIT. DID NOTE A WHITE WATER SCUM IN ONE OF THE DRAINS - NATURAL - NO ODOR. SPOKE TO MR. ARNO WHO SAID THE ROOF IS BRAND NEW. NO FURYTHER WORK REQUIRED. SITE CAN BE CLOSED. 07/21/97 CONFIRMED WITH THE DIVISION OF AIR RESOURSES THAT CAMAIR DOES NOT HAVE AIR PERMITS FOR THEIR FACILITY. THEY HAVE A SPRAY PAINTING BOOTH AND A POWDER BOOTH. THE DIVISION OF AIR RESOURCES WILL FOLLOW UP ON THIS ISSUE.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was SAC 02/02/89: JDC LEFT MESSAGE FOR MR BRIER TO FORWARD BAILING RESULTS FOR JANUARY 90'. 08/15/89: JDC WILL CONTACT SPILLER AND REQUEST RECOVERY SYSTEM BE INSTALLED TO REMOVE PRODUCT. 08/31/89: WELLS TO BAILED FOR PRODUCT FROM 8/31/89 TO 09/07/89 BY MR BRIER. BAILING RECORD TO BE SUMMITED FOR REVIEW. 09/12/89: MET W/ MR BRIER ON SITE. NORTH WELL 1/2 INCH PRODUCT, SOUTH WELL DRY. REQUESTED PUMPING OF WELL W/ MONITORING REPORTS TO BE KEPT TO MONITOR PROGRESS. 10/25/89: JDC ON SITE W/ MR BRIER. EXCAVATION FOR NEW KEROSENE TANK NEAR EXSISTING MONITORING WELL SHOWD NO PRODUCT. DEPTH OF EXCAVATION WAS APPROXIMATELY 10 FEET. NEW WELL WILL BE PLACED IN EXCAVATION. 02/28/90: JDC BAILED NORTH WELL AND RECOVERED 1/4 INCH OF PRODUCT. DRAFTED LETTER TO MR BRIER REQUESTING INVENTORY RECORDS OF BAILINGS AND CLEANUP OF CONTAMINATED WELL. 12/11/90: MJH SENT LETTER 12/10/90 REQUESTING UPDATED STATUS REPORT. 06/13/91: JDC INSPECTED WELLS AND FOUND PETROLEUM LAYER. WAITING FOR STATUS REPORT FROM MR GIERGER. 10/04/91: JDC DRAFTED LETTER TO MR BRIER REQUESTING REMEDIAL STATUS. . 07/19/92: JDC INSPECTED SITE AND FOUND THIN LAYER OF PRODUCT IN WELL. WILL DRAFT LETTER REQUESTING REMEDIAL ACTION. 11/04/93: JDC/MR. BRIER/TELECON - REQUESTED THAT MW BE SAMPLED UNDER 8021. HE AGREED TO HAVE SAMPLE DONE. 05/13/94: JDC SENT LETTER REQUESTING SAMPLING, RESPONSE DATE 6/13/94. 06/13/94: JDC LEFT MESSAGE FOR RP TO UPDATE ON STATUS PER 5/13/94 LETTER. 06/14/94: JDC TELCON W/ MR GEIGER, NATURE,S WAY TO DO GW SAMPLING. CK BK 7/30/94. 06/14/94: JDC ON SITE, OBSERVED STEVE FROM NATURE'S WAY BAIL WELL AND COLLECT WATER SAMPLE OF TWO 40ML VIALS AND ONE 1LITER JAR. CK BK 7/15/94. 08/23/94: 8021 RESULTS DATED6/14/94 INDICATE VIOLATION OF GW STANDARDS. SENT LETTER REQUESTING GW TREATMENT VIA PUMP AND TREAT. CK BK 9/21/944. 02/27/95: SENT REMINDER LETTER NO RESPONSE. CK BK 3/13/95. 1/4/96: JDC LEFT VOICE MAIL FOR RP REQUESTING GW SAMPLING AND SITE REMEDIATION PLAN. 2/19/96: NO RESPONSE FROM RP REGARDING SITE REMEDIATION PLAN. WILL INITIATE LEGAL ACTION. 8/13/96: JDC ON SITE AND FOUND NO ACTIVITY. UNABLE TO BAIL WELL FOR CONTENT. WILL INITIATE LEGAL ACTION. 11/15/96: MET W/ TWO PROSPECTIVE BUYERS MR MOHAMAD GALAB AND MR GMAL AHMED OF 2244 SENECA ST, BUFFALO, NY, PH. 826-2723 THEY WILL CONSIDER DOING SITE INVESTIGATION/ CLEANUP AT THE PROPERTY. CURRENTLY

473 EAST DELAVAN CORP (Continued) **S100119838**

NEGOTIATING WITH MR BRIER TO PURCHASE THE PROPERTY WITH CLEANUP CONDITIONS. TO DATE THEY HAVE BEEN DOING SOME SITE RESTORATION. JDC EXPLAINED CURRENT SITE STATUS WITH CLEANUP REQUIREMENTS. RECOMMENDED THEY DO TANK TESTING AND SITE SURVEY TO DETERMINE CONTAMINATION EXTENT BASED ON CURRENT SITE DATA. THEY WILL CONTINUE NEGOTIATIONS W/ MR BREIER AND ADVISE DEC OF PURCHASE STATUS. 12/2/96: JDC TELCON W/ MR GMAL AHMED, HE STATED THAT HIS ATTORNEY HAS SENT PURCHASE PROPOSAL TO MR BRIER. BASIC ELEMENTS ARE THAT MR BRIER WILL HOLD MORTGAGE WITH AN ADJUSTMENT IN THE TOTAL PURCHASE PRICE FORE CLEANUP COSTS. MR AHMED STATED THAT HE AND HIS ASSOCIATE, MR GALAB WOULD INITIATE SITE REMEDIATION REQUIREMENTS AS STATED IN PREVIOUS CORRESPONDANCE TO MR BRIER IF PROPOSAL IS ACCEPTED. HE WILL NOTIFY 12/5/96: DRAFTED SHORT ORDER CONSENT AGAINST MR JAMES BRIER. 3/29/97: JDC RESUBMITTED LEGAL SHORT ORDER CONSENT, INITIAL WAS NOT PROCESSED. 11/19/02:AES, SAC INSPECT SITE, 2 MONITORING WELLS FOUND ON-SITE AND A NEW PUMP ISLAND CANOPY WAS INSTALLED, MR. HAROLD GEIGER CAME TO THE SITE, SAC TOLD HIM ABOUT OPEN SPILL, MR. GEIGER SAID HE WAS UNAWARE OF SPILL, SAC TOLD HIM SITE ASSESSMENT IS REQUIRED, WILL FOLLOW UP W/LETTER REQUIRING SITE ASSESSMENT IN A MONTH OR SITE WILL BE REFERRED TO LEGAL DEPARTMENT. 11/21/02:SAC DISCUSS SITE W/PJB, PJB REQUESTED WELLS BE SAMPLED FIRST TO DETERMINE IF PRODUCT REMAINS IN WELL AND TO HAVE WELLS SAMPLED AND ANALYZED, BASED ON RESULTS FURTHER WORK MAYBE REQUIRED, IF NO SAMPLING TAKES PLACE THEN SITE WILL BE REFERED TO LEGAL AFFAIRS. 11/22/02:DRAFTED LETTER REQUIRING SAMPLING AND ANALYZING OF THE WELLS, RESULTS MUST BE RECEIVED BY JANUARY 15, 2003 OR WE REFER SITE TO LEGAL AFFAIRS. 12/17/02:SAC TELECON HAROLD GEIGER, MR. GEIGER SAID THAT HE IS GOING TO CONTACT UPSTATE LABORAOTRIES TO TAKE SAMPLES, HE AGREED TO CONTACT SAC WHEN SAMPLES WILL BE TAKEN AND HE WILL BE PRESENT ALSO. 1/14/03:SAC INSPECT SITE, MET W/HAROLD GEIGER AND SCOTT OVERHOFF - HAZARD EVALUATIONS WHO WAS HIRED TO SAMPLE THE WELLS, BOTH WELLS DID NOT HAVE SEPARATE PHASE PRODUCT, WATER IN BOTH WELLS DID HAVE INTERMITTENT VERY SLIGHT STRINGY SHEEN, WELL NEAREST THE KEROSENE TANK HAD STRONG STALE/SEWER TYPE ODORS, NO ODORS OBSERVED IN WELL NEAREST THE CORNER. 2/17/03:SAC TELECON SCOTT OVERHOFF - HAZARD EVALUATIONS, MR. OVERHOFF RECEIVED ANALYTICAL RESULTS FROM SAMPLING AND IS WAITING FOR APPROVAL FROM MR. GEIGER TO SEND THEM INTO TO DEC, SAC TELECON HAROLD GEIGER, MR. GEIGER WAS UNAWARE THAT SAMPLE RESULTS WERE NOT SENT TO DEC AND WILL CALL HAZARD EVALUATIONS TO APPROVE HAVING THE RESULTS SENT TO DEC, SAC DRAFTED LETTER REQUIRING RESULTS BY 2/28/03. 2/18/03:SAC TELECON SCOTT OVERHOFF, HE SPOKE TO MR. GEIGER AND HE WILL BE SENDING IN A COPY OF THE RESULTS FROM THE WELL SAMPLING. 2/20/03:RECEIVED COPY OF RESULTS FROM WELL SAMPLING, THE RESULTS OF THE SOUTH WELL ARE ABOVE GROUNDWATER STANDARDS AND THE TOTAL 8260 STARS PARAMETERS ARE ALMOST 11000 ppb WITH A TOLUENE CONCENTRATION OF 9700 ppb, DRAFTED LETTER REQUIRING WORKPLAN BY 4/15/03. 4/2/03:SAC MET W/HAROLD GEIGER, MR. GEIGER REQUESTED THAT HE ONLY TREAT THE WELL, SAC AGREED TO ALLOW THIS AS A FIRST APPROACH, MR. GEIGER WILL CONTACT SCOTT OVERHOFF TO DEVELOP WORKPLAN AND DO THE WORK. 4/16/03:RECEIVED WORKPLAN FROM ENSOL TO BIOTREAT THE WELLS ON-SITE THROUGH FOUR INJECTIONS. 8/27/03:RECEIVED FIELD REPORTS FOR THE BIOTREATMENT OF THE WELLS. 10/30/03:RECEIVED RESULTS OF SAMPLING AFTER BIO-TREATMENT, LEVELS IN WELLS HAVE DECREASED, NORTH WELL HAD LEVEL OF 3.07 ug/l FOR VOLATILES AND 29.2 ug/l FOR MTBE, SOUTH WELL LEVEL WAS ND AND 3.04 ug/l FOR MTBE. 11/10/03:DRAFTED LETTER REQUIRING ADDITIONAL SAMPLING OF WELLS NEXT SPRING. 4/22/04:RECEIVED SECOND ROUND OF WELL SAMPLING. 5/10/04:REVIEWED 2ND ROUND OF SAMPLING, RESULTS WERE BELOW GW

473 EAST DELAVAN CORP (Continued) **S100119838**

STANDARDS EXCEPT FOR MTBE ON A LOW LEVEL, NO FURTHER WORK REQUIRED, DRAFTED I LETTER.

Remarks: UNDERGROUND TANKS REMOVED W/ CONTAMINATION PRESENT IN THE EXCAVATION. MONITORING WELL TO THE NORTH HAS SEVERAL INCHES OF PRODUCT IN IT.

Hazardous Waste Summary:

Waste Code:	D000
Waste Description:	Not Defined
Waste Code:	D001
Waste Description:	Ignitable Waste
Waste Code:	F001
Waste Description:	The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F005
Waste Description:	The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.
Waste Code:	F007
Waste Description:	Spent Cyanide Plating Bath Solutions From Electroplating Operations.

Environmental Interest/Information System:

The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was MNP 12/08/95: MNP INSPECTION, MET WITH JERRY MILNE - EISENBACH & PETER PARAGON - ALASKAN. 1 15K #6 OIL TANK EMPTIED & CLEANED IN PLACE, WATER ENTERING BOTTOM OF TANK. WARMING 2ND #6 OIL TANK, TO BE CLEANED IN PLACE. BLACK OILY SOIL BETWEEN 2 PARTIALLY EXPOSED TANKS. 1 OF 2 CHLORINATED SOLVENT TANKS REMOVED & CLEANED, THEY NOTICED SOLVENT ODOR WHILE REMOVING. OTHER SOLVENT TANK PARTIALLY EXPOSED. NOTE: THEY HAVE INSTALLED 6 2 MW'S ON SITE. MILNE TOLD ME THEY DETECTED PCB'S, ETC. IN MW CLOSEST TO SOLVENT TANKS. I ASKED FOR DAVE COMENALE TO CALL ME NEXT WEEK & ADVISE WHEN READY TO PULL REMAINING TANKS. 12/12/95: MNP TELECON WITH DAVE COMENALE - EISENBACH. PLAN TO PUMP WATER OUT FROM TANKS. I GAVE HIM DISPOSAL & TREATMENT OPTIONS. TO PULL TANKS NEXT WEEK. HE WILL NOTIFY ME FOR INSP. BEFORE BACKFILLING. ALSO, MW SAMPLE RESULTS SENT TO DEC, BUT HAD TO CHECK TO FIND OUT WHO. 12/12/95: RECEIVED FAX OF LETTER TO MARTIN DOSTER, INDICATING INVESTIGATION REPORT ATTACHED FOR REVIEW. 12/15/95: MNP DISCUSSED WITH MARTY DOSTER. HE RECEIVED PRELIMINARY INVESTIGATON REPORT INDICATING MINOR CONTAMINANTS AT SITE. DOSTER GAVE ME REPORT TO REVIEW. 12/22/95: MNP REVIEW OF 7/19/94 EISENBACH INVESTIGATION REPORT. LOW PPB EXCEEDANCES OF STARS MEMO #1 & TCE IN MW'S & SOIL BORINGS. 01/02/96: MNP TELECON WITH DAVE COMENALE - EISENBACH. PLAN TO REMOVE OIL & SOLVENT TANKS BY END OF NEXT WEEK. I ASKED FOR ADVANCE NOTIFICATION FOR DEC INSP. BEFORE BACKFILLING. WE DISCUSSED SAMPLING OF OIL & SOLVENT TANK PITS. HE WILL FAX SAMPLING PLAN WITH TANK WATER SAMPLING RESULTS. TO SEND LETTER. 01/03/96: MNP & MARTY DOSTER DISCUSSION. NO DHWR INVOLVEMENT NEEDED AT THIS TIME. DSM TO FOLLOWUP, TO LET DOSTER KNOW ABOUT ANY SIGNIFICANT HAZ-WASTE CONTAMINANTS. 01/08/96: MNP TELECON WITH DAVE COMENALE - EISENBACH. TANKS TO BE REMOVED 1/10/96, TO CALL WHEN READY TO INSP. COMENALE WILL SEND HIS SAMPLING PLAN ASAP. 01/16/96: MNP INSPECTION, MET WITH JERRY MILNE - EISENBACH & LARRY SCHIAVONNE - CITY OF BUFFALO. ALL 4 TANKS REMOVED. SMALL PILE OF OI CONTAMINATED SOIL STAGED ON PLASTIC. CONTAMINATED SOIL & APPROX. 1 FOOT OF WATER WITH SHEEN IN #6 TANK PIT. OIL PRODUCT SEEPING IN FROM SIDES. CONTAMINATED WATER & SOIL MUST BE REMOVED. NOTE - CONCRETE PAD ON BOTTOM OF TANK PIT; PAD MUST BE REMOVED, BUT NOT UNTIL WATER IS PUMPED OUT. ALSO, CHECKED SOLVENT

CITY OF BUFFALO (Continued) **S100560418**

TANK PIT, WATER CLEAR, NO VISIBLE CONTAMINATION OR ODOR. 01/16/96: MNP TELECON WITH DAVID COMENALE - EISENBACH. DISCUSSED WATER & CONTAMINATED SOIL REMOVAL & SAMPLING REQUIREMENTS, STILL NEED SAMPLING PLAN FOR SOLVENT TANK PIT. 01/17/96: MNP TELECON WITH DAVID COMENALE - EISENBACH. DISCUSSED WATER SAMPLING & DISPOSAL OPTIONS. RECOMMENDED WATER REMOVAL PRIOR TO ADDITIONAL EXCAVATION OR REMOVAL OF CONCRETE PAD. 01/24/96: MNP TELECON TO DAVID COMENALE - EISENBACH. NOT IN, LEFT MESSAGE TO RETURN CALL. 01/24/96: MNP TELECON WITH DAVID COMENALE - EISENBACH. HE SAMPLED WATER IN #6 TANK PIT TO OBTAIN APPROVAL FROM BSA TO DISCHARGE INTO SEWER, EXPECTS RESULTS TODAY. PLAN TO PUMP OUT WATER & CONTINUE CLEANUP NEXT WEEK. HE AGREED TO NOTIFY ME IN ADVANCE TO ARRANGE INSP. PRIOR TO ANY BACKFILLING. HE IS ALSO WAITING FOR RESULTS FROM HIS LAB ON THE METHANAL & KETONE TO DETERMINE WHAT SAMPLING TO DO ON SOLVENT TANK PIT. TO FAX ME SAMPLING PLAN. 01/30/96: PROPOSED SOLVENT SAMPLE PLAN & 4/27/95 SAMPLE RESULTS OF SOLVENT TANKS. SOME EXCEEDANCES OF STARS MEMO #1 & HIGH TPH NOTED, ESPECIALLY IN NORTH TANK. TO SAMPLE BOTH SOLVENT TANK PITS FOR EPA METHODS 8021 STARS MEMO #1, 8260 VOLATILES, KETONES & METHANOL. TO SAMPLE SIDES & BOTTOM OF EACH PIT ALONG WITH A SEPARATE GW SAMPLE 02/02/96: MNP TELECON WITH DAVID COMENALE - EISENBACH. TO COMPLETE CONTRACT CITY THIS WEEK & PLAN TO DO TANK PIT EXCAVATION & SAMPLING WEEK OF 2/12/96. HE WILL CALL AT LEAST 2 DAYS PRIOR WITH FIRM SCHEDULE. 03/21/96: MNP TELECON WITH TONY C. - EISENBACH. DAVID COMENALE NO LONGER WITH COMPANY, TONY DID NOT KNOW WHO WAS IN CHARGE OF PROJECT. HE WILL HAVE SOMEONE CALL ME. 03/22/96:MNP TELECON WITH JACK EISENBACH - EISENBACH. HE IS NOW HANDLING THIS PROJECT PERSONALLY. ADDITIONAL SOIL & WATER SAMPLES HAVE BEEN COLLECTED. HE WILL SEND ME A LETTER WITH A WORK SCHEDULE EARLY NEXT WEEK. 04/11/96: RECEIVED LETTER FROM JACK EISENBACH. THEY COLLECTED SOIL & WATER SAMPLES LAST WEEK, INCLUDING THE TANK PIT. SOME ADDITIONAL EXCAVATION WAS DONE ON THE EAST END OF THE SITE. EXPECT SAMPLE RESULTS IN ONE WEEK. TO FORWARD SAMPLE RESULTS WITH ACTION PLAN FOR DEC REVIEW WITHIN 2-3 WEEKS. 04/30/96: RECEIVED JACK EISENBACH REPORT CONTAINING 3/21/96 SAMPLES. 05/06/96: MNP REVIEW OF JACK EISENBACH REPORT. SAMPLES ANALYZED FOR TOTAL HEAVY METALS, PCB'S, HALOGENATED VOLATILES, AROMATIC VOLATILES, PETROLEUM PRODUCTS, & SEMIVOLATILES. NORTH & SOUTH TANK PITS MEET STARS #1. FUEL OIL TANK PIT BOTTOM EXCEEDS STARS #1 & DETECTED TRICHLOROETHENE AT 800 PPB. ALSO MW'S 1,2,4,6,7 MEET STARS #1 CRITERIA. FUEL OIL TANK PIT NEEDS REMEDIATION. 05/15/96: MNP INSPECTION, MET WITH ERIC DOUSHARM - JEE & ALASKAN OIL REMEDIATION. OVER 200 CU YDS OIL CONTAMINATED SOIL EXCAVATED SO FAR. OIL FILM & SHEEN ON WATER IN EXCAVATION. UNABLE TO CHECK BOTTOM OF EXCAVATION. WORK STILL UNDERWAY. THEY STOPPED PUMPING WATER WHEN OIL APPEARED EARLIER TODAY. THE OILY WATER MUST BE PUMPED OUT TO CHECK EXCAVATION & DETERMINE IF CONCRETE SLAB MUST BE REMOVED. TO DISCUSS IN MEETING AT CITY HALL TOMORROW. JEE TO CALL ME WHEN READY FOR ANOTHER INSP. 05/17/96: MNP INSPECTION, MET WITH ERIC DOUSHARM - JEE. THEY ALREADY EXCAVATED ABOUT 500 TONS PETROLEUM CONTAMINATED SOIL. SHEEN ON WATER IN EXCAVATION. ONLY 3,000 GALS. WATER PUMPED INTO VAC TRUCK, DECANTED 1 HR BEFORE DISCHARGING TO BSA SEWER SYSTEM. THEY HAVE REMOVED CONCRETE PAD FROM BOTTOM OF EXCAVATION. VISIBLE CLEAN CLAY BELOW. 2 COMPOSITE SIDE SAMPLES COLLECTED, BUT NEED NORTH SIDE SAMPLED YET. ALSO, I REQUESTED 2 WATER SAMPLES. NEED TO ANALYZE FOR EPA 8021 & 8270, STARS #1 & DOH 310-13. I RECOMMENDED PUMPING MORE WATER BEFORE COLLECTING WATER SAMPLES. I REQUESTED NO BACKFILLING OF EXCAVATION UNTIL DEC REVIEWS SAMPLE RESULTS. 06/18/96: RECEIVED FAX COPY OF SAMPLE RESULTS FROM JEE.

CITY OF BUFFALO (Continued) **S100560418**

06/19/96: RECEIVED NOTE ATTACHED TO FAX COPY OF ABOVE SAMPLE RESULTS FROM MARTY DOSTER - DHWR. INDICATED HIGH LEVELS. 06/27/96: MNP REVIEWED CES 6/17/96 SAMPLE REPORT. SIDE SAMPLE EXCEEDED STARS #1 FOR EPA METHODS 8021 & 8270; INDIVIDUAL LEVELS BETWEEN 35-500 PPB FOR SEMI-VOLATILES & 180-1570 PPB FOR VOLATILES. BOTTOM OF PIT SAMPLES BELOW STARS #1 LIMITS. MORE CLEANUP NEEDED. 07/01/96: MNP TELECON WITH DAVID BABOWITZ - JEE. EXCAVATION BACKFILLED BEFORE GROUNDWATER SAMPLES WERE COLLECTED. I REMINDED HIM DEC REQUESTED EXCAVATION REMAIN OPEN. WE DISCUSSED HIGH SAMPLE RESULTS FOR SIDE SAMPLE. NEED REMEDIATION PLAN TO ADDRESS REMAINING CONTAMINATION IN SOIL & GW. 09/16/96: RECEIVED REMEDIATION PLAN FROM JES. THEY PLAN TO EXCAVATE REMAINING CONTAMINATION AT THE SITE. 09/23/96: MNP TELECON W/ DAVID BABOWITZ - JEE. DISCUSSED REMEDIATION PLAN TO EXCAVATE ADDITIONAL CONTAMINATION AT THE SITE. I RECOMMENDED TEST PITS AROUND ORIGINAL TANK PIT PRIOR TO REMEDIATION, SO THEY CAN DETERMINE EXTENT OF GROUNDWATER & SOIL CONTAMINATION. I ALSO REQUESTED A WORK SCHEDULE SO I CAN INSPECT SITE BEFORE ANY BACKFILLING. HE WILL ADVISE JACK EISENBACH OF MY RECOMMENDATIONS. WE ALSO SETUP UP A MEETING WITH JACK EISENBACH IN OUR OFFICE ON 9/26/96 AT 1:00PM. 10/08/96: MNP TELECON WITH DAVID BABOWITZ - JEE. TO EXCAVATE TEST PITS ON 10/10/96. I WILL MEET MARK RUNKE - JEE ON SITE AT 10:00 AM. 10/10/96: MNP INSPECTION & MEETING WITH MARK RUNKE - JEE. 3 TEST PITS DUG OUTSIDE ORIGINAL TANK PIT. TP#1 - RED CLAY, NO VISIBLE CONTAMINATION; TP#2 - OIL CONTAMINATED SOIL & DEBRIS, SHEEN ON WATER; TP#3 - CONCRETE DEBIS, NO VISIBLE SHEEN; TP#4 - DEBRIS DOWN TO 4 FT. THEN CLAY, NO VISIBLE CONTAMINATION. RUNKE TO SEND REPORT WITH CLEANUP RECOMENDATIONS. (SEE SKETCH) 12/18/96: MNP INSPECTION, NO CHANGE SINCE OCTOBER. NO MORE CLEANUP DONE YET. 01/06/97: MNP TELECON WITH MARK RUNKE - JEE. EXCAVATIONS RESAMPLED RECENTLY, PLAN TO VAC OIL/WATER & EXCAVATE CONTAMINATED SOIL WEEK OF 1/13/97. 01/09/97: RECEIVED LETTER FROM RUNKE - JEE. WORK TO BEGIN WEEK OF 1/13/97, TO NOTIFY IN ADVANCE WHAT DAY WORK WILL BEGIN. 01/10/97: MNP TELECON WITH MARK RUNKE - JEE. TO START DIGGING ON 1/14/97, I WILL TRY TO INSPECT THAT AFTERNOON OR 1/15/97 IN AM. 01/10/97: RECEIVED FAX INDICATING WORK STARTING 1/14/97 AT 7:00 AM. 01/24/97: MNP TELECON WITH DAVID BABOWITZ - JEE. HE RECEIVED SAMPLE RESULTS FROM CES. ALL SOIL SAMPLES OK, BUT MINOR EXCEEDANCES IN GW. HE WILL FAX COPY OF SAMPLE REPORT FOR MY REVIEW. 01/24/97: RECEIVED FAX OF CES 1/24/97 SAMPLE REPORT. SOIL SAMPLES MEET STARS #1, BUT 1,2,4 TRIMETHYLBENZENE & NAPTHALENE EXCEEDS NYSDEC STANDARDS IN BOTH GW SAMPLES. 01/29/97: MNP TELECON WITH DAVID BABOWITZ - JEE. WE DISCUSSED GW SAMPLE RESULTS, 1,2,4 TRIMETHYLBENZENE & NAPTHALENE EXCEEDS NYSDEC STANDARDS. DEC CAN MAKE SITE INACTIVE, BUT CITY WANTS JEE TO MEET DEC CLSURE REQUIREMENTS. BABOWITZ PROPOSED PUMPING OUT REMAINING WATER INTO BSA (USING PERMIT), THEN RESAMPLE. IF GW SAMPLE RESULTS MEET DEC LIMITS SITE CAN BE CLOSED. I AGREED WITH PROPOSAL & WILL SEND A LETTER TO CITY WITH CC TO JEE. 03/13/97: MNP INSPECTION, MET WITH MARK RUNKE & DAVID BABOWITZ - JEE. REMAINING CONTAMINATED SOIL BEING HAULED OFF SITE. WATER BEING PUMPED FROM EXCAVATION FOR OVER 5 HOURS. ESTIMATE 12 WATER LEVEL DROP. LESS THAN HALF OF WATER REMOVED. JEE TO CONTINUE PUMPING THEN COLLECT WATER SAMPLE AT END OF DAY. DEC CLOSURE DECISION WILL BE BASED ON SAMPLE RESULTS IF VOLUME OF WATER PUMPED IS CONSIDERED TO BE REPRESENTATIVE. WE ALSO CHECKED CLOSEST MW'S, NO SHEENS OR ODORS NOTED. 03/20/97: RECEIVED COPY OF LETTER TO CITY HALL SUMMARIZING STATUS OF PROJECT. 03/26/97: RECEIVED LETTER & CES 3/21/97 SAMPLE REPORT. THE 2 SAMPLES COLLECTED FROM THE EXCAVATION ON 3/13/97 WERE ANALYZED FOR EPA METHODS 8021 & 8270, STARS #1. BOTH

CITY OF BUFFALO (Continued) **S100560418**

SAMPLES NON-DETECT & MEET STARS #1 GUIDANCE VALUES & NYSDEC GW STANDARDS. NO CHAIN OF CUSTODY ATTACHED. HOLD FOR FINAL CLOSURE REPORT FROM JEE. 04/24/97: RECEIVED FINAL CLOSURE REPORT FROM JEE. 06/04/97: MNP REVIEWED JEE CLOSURE REPORT. CLEANUP SATISFACTORY. LAST SAMPLE RESULTS MEET NYSDEC GW STANDARDS & GUIDANCE VALUES. SOIL DISPOSAL RECEIPTS SUBMITTED. TO SEND CLOSURE LETTER TO CITY OF BUFFALO. 06/09/97: CLOSURE LETTER SENT TO LAWRENCE SCHIAVONNE - CITY OF BUFFALO. NO FURTHER ACTION NEEDED, COMPLETE.

Record Added: 10/28/2003
Record Updated: 02/19/2013
Updated By: MLDOSTER
Site Description: Location: The 858 East Ferry Street site is a 3.32 acre property located in the City of Buffalo. The site is located in an urban area. Site Features: The site is currently a vacant lot. The site is situated on the north side of East Ferry Street and is zoned as commercial/industrial. The site is bordered on the north by a New York Central Railroad embankment and industrial property occupied by International Extruded Products. The True Bethel Baptist Church is located opposite of the site, on the south side of East Ferry Street. TNT Used Autos, a small used car lot, is located to the west of the site. The adjacent properties west of the site are currently zoned commercial/industrial. Current Zoning/Use(s): This site is currently vacant and zoned for industrial use. Historical Use(s): At the adjacent property to the west of 858 E. Ferry Street, now occupied by the used auto lot, the 1939 Sanborn map showed that a Michael Heyman Company operated a zinc and lead smelting and refining facility. Two buildings were once located on the Heyman property; the west building was the foundry and blast furnace, and the east building, nearest the 858 E. Ferry Street site, housed the metal casting facility. A 1958 aerial photo shows a path leading from the Heyman property to the central part of the East Ferry Street site. The location of the Heyman facility adjacent to the site and the path leading onto the site support the past disposal of lead-contaminated ash in this location. Under the Environmental Restoration Program (ERP), the City of Buffalo completed an investigation in 1997-1998. The results from this investigation showed significant lead contamination in soil. Based on the results of this investigation, a ROD was signed by NYSDEC in March 1999. The selected remedy included the excavation and off-site disposal of hazardous waste and contaminated soil. The ROD also stated that the remedy would be deferred until further investigation is conducted to the west of the site. Since extensive off-site contamination was found the NYSDEC conducted the additional off-site investigation and completed remediation of the site under

EAST FERRY STREET (Continued) **S113917194**

the State Superfund program. The site is currently considered as a single operable unit. An additional investigation was completed in 2001 by the NYSDEC at adjacent properties and the results indicated that the soil is contaminated with lead on adjacent properties. The March 1999 ROD was amended in August 2005 based on a significant increase in volume of lead contaminated soil. The amended remedy included the excavation of surface and subsurface contaminated soil from the site and disposal to a permitted landfill to achieve a clean up goal for unrestricted future use and the excavation of contaminated soil from off-site properties and disposal to a permitted landfill to achieve a clean up goal for industrial/commercial use which is consistent with the current zoning. The remedial design of the amended remedy was completed in February 2006. The remedial action completed in 2007 at the site and off-site properties removed the lead-contaminated soils from surface and subsurface. The excavated soils were treated on-site and disposed appropriately in an off-site landfill. Since the contaminated soils were removed the groundwater contamination was expected to decrease. After the successful completion of the remedial action at the site, a groundwater sampling event was conducted in May 2009. The results indicated that the on-site wells did not show lead contamination above groundwater standards, which was consistent with the sampling event during the investigation. Therefore, the site can be delisted and groundwater at the site need not be monitored in the future. Currently public water supply is available in this area. Operable Units: Site Geology and Hydrogeology: The overburden deposits in the region have been mapped as lake silts and clays. The thickness of the overburden at the study area varies from approximately 8.4 feet to 17.5 feet. Beneath the overburden deposits, the bedrock consists of the Middle Devonian age Onondaga Limestone. The primary hydrogeologic unit identified beneath the study area is the unconfined watertable aquifer present in the limestone of the Onondaga Formation. However, groundwater is present in the overburden and is found primarily in the ash type fill material and in the backfilled excavation of the Scajaquada Creek Drain. The water in the overburden is reportedly connected to the bedrock groundwater. Groundwater generally flows toward the Scajaquada Creek Drain.

Env Problem: Nature and Extent of Contamination: Based on the results from investigations conducted at the site the lead-contaminated soils found at the on-site and off-site areas were located near and over the top of the covered Scajaquada Creek drain. The highest concentration of total lead detected in the surface soil was 11,500 ppm, which was found beneath a pile of gray ash. The concentrations found in the subsurface soil were as high as 28,500 ppm lead. There was a potential for the contamination from the soil to migrate to Creek Drain and the groundwater. During the investigation groundwater samples were collected from the site and off-site. Total lead was detected at a concentration of 400 g/l in the groundwater sample collected from the well located on the 856 East Ferry Street property. The sample from this well was the only sample that reported lead concentrations exceeding the NYSDEC groundwater standard. The remaining groundwater samples analyzed have detected total lead at or below groundwater standard. As stated in the amended Record of Decision (ROD), the remedial action completed in 2007 at the on-site and off-site properties removed lead contaminated soils from surface and subsurface to a clean up goal of 400 ppm of lead at the site and 1000 ppm of lead at off-site properties. As stated in the amended

EAST FERRY STREET (Continued) **S113917194**

ROD, the goal of remediating the site to unrestricted future was achieved by implementing the remedy. After the successful completion of the remedial action at the site, a groundwater sampling event was conducted in May 2009. The results indicated that the on-site wells did not show lead contamination above groundwater standards, which was consistent with the sampling event during the investigation. Therefore, groundwater at the site need not be monitored in the future. Currently public water supply is available in this area. Special Resources Impacted/Threatened: Significant Threat:

Updated By: MLDOSTER
Site Description: Location: The 858 East Ferry Street site is a 3.32 acre property located in the City of Buffalo. The site is located in an urban area. Site Features: The site is currently a vacant lot. The site is situated on the north side of East Ferry Street and is zoned as commercial/industrial. The site is bordered on the north by a New York Central Railroad embankment and industrial property occupied by International Extruded Products. The True Bethel Baptist Church is located opposite of the site, on the south side of East Ferry Street. TNT Used Autos, a small used car lot, is located to the west of the site. The adjacent properties west of the site are currently zoned commercial/industrial. Current Zoning/Use(s): This site is currently vacant and zoned for industrial use. Historical Use(s): At the adjacent property to the west of 858 E. Ferry Street, now occupied by the used auto lot, the 1939 Sanborn map showed that a Michael Heyman Company operated a zinc and lead smelting and refining facility. Two buildings were once located on the Heyman property; the west building was the foundry and blast furnace, and the east building, nearest the 858 E. Ferry Street site, housed the metal casting facility. A 1958 aerial photo shows a path leading from the Heyman property to the central part of the East Ferry Street site. The location of the Heyman facility adjacent to the site and the path leading onto the site support the past disposal of lead-contaminated ash in this location. Under the Environmental Restoration Program (ERP), the City of Buffalo completed an investigation in 1997-1998. The results from this investigation showed significant lead contamination in soil. Based on the results of this investigation, a ROD was signed by NYSDEC in March 1999. The selected remedy included the excavation and off-site disposal of hazardous waste and contaminated soil. The ROD also stated that the remedy would be deferred until further investigation is conducted to the west of the site. Since extensive off-site contamination was found the NYSDEC conducted the additional off-site investigation and completed remediation of the site under the State Superfund program. The site is currently considered as a single operable unit. An additional investigation was completed in 2001 by the NYSDEC at adjacent properties and the results indicated that the soil is contaminated with lead on adjacent properties. The March 1999 ROD was amended in August 2005 based on a significant increase in volume of lead contaminated soil. The amended remedy included the excavation of surface and subsurface contaminated soil from the site and disposal to a permitted landfill to achieve a clean up goal for unrestricted future use and the excavation of contaminated soil from off-site properties and disposal to a permitted landfill to achieve a clean up goal for industrial/commercial use which is consistent with the current zoning. The remedial design of the amended remedy was completed in February 2006. The remedial action completed in 2007 at the site and off-site properties removed the lead-contaminated soils from surface and subsurface. The excavated soils were treated on-site and disposed appropriately in an off-site landfill. Since the contaminated soils were removed the groundwater contamination was expected to decrease. After the successful completion of the remedial action at the site, a groundwater sampling event was conducted in May 2009. The results indicated that the on-site wells did not show lead contamination above groundwater standards, which was consistent with the sampling

858 EAST FERRY STREET (Continued) **S104541709**

event during the investigation. Therefore, the site can be delisted and groundwater at the site need not be monitored in the future. Currently public water supply is available in this area. The process of delisting the site has been completed. The site will be designated as 'C' which refers to as completed remediation. No monitoring or institutional controls are required. Site Geology and Hydrogeology: The overburden deposits in the region have been mapped as lake silts and clays. The thickness of the overburden at the study area varies from approximately 8.4 feet to 17.5 feet. Beneath the overburden deposits, the bedrock consists of the Middle Devonian age Onondaga Limestone. The primary hydrogeologic unit identified beneath the study area is the unconfined watertable aquifer present in the limestone of the Onondaga Formation. However, groundwater is present in the overburden and is found primarily in the ash type fill material and in the backfilled excavation of the Scajaquada Creek Drain. The water in the overburden is reportedly connected to the bedrock groundwater. Groundwater generally flows toward the Scajaquada Creek Drain.

Env Problem: Nature and Extent of Contamination: Prior to Remediation: Based on the results from investigations conducted at the site the lead-contaminated soils found at the on-site and off-site areas were located near and over the top of the covered Scajaquada Creek drain. The highest concentration of total lead detected in the surface soil was 11,500 ppm, which was found beneath a pile of gray ash. The concentrations found in the subsurface soil were as high as 28,500 ppm lead. There was a potential for the contamination from the soil to migrate to Creek Drain and the groundwater. During the investigation groundwater samples were collected from the site and off-site. Total lead was detected at a concentration of 400 g/l in the groundwater sample collected from the well located on the 856 East Ferry Street property. The sample from this well was the only sample that reported lead concentrations exceeding the NYSDEC groundwater standard. The remaining groundwater samples analyzed have detected total lead at or below groundwater standard.
Post-Remediation: As stated in the amended Record of Decision (ROD), the remedial action completed in 2007 at the on-site and off-site properties removed lead contaminated soils from surface and subsurface to a clean up goal of 400 ppm of lead at the site and 1000 ppm of lead at off-site properties. As stated in the amended ROD, the goal of remediating the site to unrestricted future was achieved by implementing the remedy. After the successful completion of the remedial action at the site, a groundwater sampling event was conducted in May 2009. The results indicated that the on-site wells did not show lead contamination above groundwater standards, which was consistent with the sampling event during the investigation. Therefore, groundwater at the site need not be monitored in the future. Currently public water supply is available in this area. Currently the site declassified as 'C" indicating that the remediation is completed at the site and no future monitoring of the site is required.

Health Problem: No human exposure to contamination from this site is expected since contaminated soil is either removed or covered and public water serves the area.

Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

BROWNFIELDS:

Name:	MT. OLIVE SENIOR MANOR SITE
Address:	703 EAST DELAVAN AVENUE
City,State,Zip:	BUFFALO, NY 14215
Program:	BCP
Site Code:	618622
Acres:	1.300
HW Code:	C915377
SWIS:	1502
Town:	Buffalo (c)
Record Added Date:	04/30/2021
Record Updated Date:	05/10/2023
Update By:	AECAPRIO
Site Description:	Location: The Mt. Olive Senior Manor site is an approximately 1.3-acre site located in a highly developed urban area at 703 East Delavan Avenue in the City of Buffalo, Erie County. The other portion of the 2.63-acre parcel at 703 East Delevan Avenue is not part of the BCP site. The site is at the southeast corner of East Delavan and Sheridan Avenues. It is bordered by the remaining portion of 703 East Delavan to the north, commercial and industrial properties to the south, an industrial property to the west and Sheridan Avenue to the east. Site Features: The site consists of a grass covered athletic field and a small portion of an adjacent asphalt parking lot to the north. Zoning and Land Use: The current zoning for the Site is N-3R (Residential), defined as moderately compact residential blocks, which occasionally include small mixed-use buildings. The site is currently a grass covered athletic field. The redevelopment plan for the site is a 3-story affordable housing development for seniors, consistent with the zoning assigned to the site. Past Use of the Site: The 703 East Delavan parcel which includes this site has historically been developed with a church building, an associated parking lot and an athletic field. Historic fuel oil and gasoline storage tanks were identified in close proximity to the site along with historic automobile repair and rug/furniture cleaning, possibly with dry-cleaning operations, which were identified adjacent to the site. Site Geology and Hydrogeology: Previous investigation identified the site geology as primarily vegetative topsoil cover over varying types of fill materials ranging in depth from 3 inches to 2 feet below ground surface (fbgs) underlain by silty sand and/or fine sand in some locations. The site is situated over the Onondaga Formation. The Onondaga Formation is comprised of a limestone of varying texture, from coarse to very finely crystalline, with a dark gray to tan color and chert and fossils within. The unit has an approximate thickness of 150 feet. The depth to bedrock was identified at approximately 2 to 6 fbgs. The site is located within the Lake Erie-Niagara River major drainage basin, which is typified by little topographic relief that gently slopes westward towards Lake Erie and the Niagara River, except in the immediate vicinity of major drainage ways. Regionally, groundwater is expected to flow westerly towards the Niagara River. Locally, groundwater was not encountered

MT. OLIVE SENIOR MANOR SITE (Continued) **S127750702**

Env Problem:

during previous investigations in the site overburden. Groundwater is present in the underlying bedrock at the site and flows to the west. Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), herbicides/pesticides, and per- and polyfluoroalkyl substances (PFAS). Soil vapor was analyzed for VOCs. The primary contaminants of concern are VOCs, SVOCs, herbicides/pesticides and emerging contaminants above unrestricted soil cleanup objectives (USCOs) as follows. Surface Soils: Surface soils were sampled from 0-2 inches below ground surface (bgs) and analyzed for SVOCs, metals, PCBs, herbicides/pesticides, and emerging contaminants. SVOCs detected in surface soil samples included benzo(a)anthracene at concentrations up to 8 parts per million (ppm) (USCO 1 ppm), benzo(a)pyrene at concentrations up to 8.4 ppm (USCO 1.0 ppm); benzo(b)fluoranthene at concentrations up to 9.6 ppm (USCO 1 ppm); benzo(k)fluoranthene at concentrations up to 3.7 ppm (USCO 0.8 ppm); chrysene at concentrations up to 7 ppm (USCO 1 ppm); dibenzo(a,h)anthracene at concentrations up to 1.3 ppm (USCO 0.33 ppm); and indeno(1,2,3-cd)pyrene at concentrations up to 4.4 ppm (USCO 0.5 ppm). Metals detected in surface soil samples included lead at concentrations up to 105 ppm (USCO 63 ppm); mercury at concentrations up to 0.2 ppm (USCO 0.18 ppm); chromium at concentrations up to 72.3 ppm (USCO 30 ppm); copper at concentrations up to 74 ppm (USCO 50 ppm); nickel at concentrations up to 205 ppm (USCO 30 ppm); and zinc at concentrations up to 144 ppm (USCO 109 ppm). PCBs were detected at concentrations up to 0.23 ppm (USCO 0.1 ppm) USCOs. Perfluorooctanesulfonic acid (PFOS) was detected in surface soil at concentrations up to 3.1 ppb (unrestricted use guidance value 0.88 parts per billion [ppb]). PFOA was not detected. Pesticides and herbicides detected in surface soil samples include 4,4'-DDE at concentrations up to 0.01 ppm (USCO 0.0033 ppm) and 4,4'-DDT at concentrations up to 0.015 ppm (USCO 0.0033 ppm). Data does not indicate any off-site impacts in surface soil emanating from the site. Subsurface soils: Subsurface soils were sampled from 2 inches to 3 feet bgs and analyzed for volatile organic compounds (VOCs), SVOCs, metals, herbicides/pesticides, PCBs and emerging contaminants. There were no exceedances of USCOs for VOCs identified in these samples. SVOCs detected in subsurface soils include benzo(a)anthracene at concentrations up to 41 ppm (USCO 1 ppm); benzo(a)pyrene at concentrations up to 40 ppm (USCO 1 ppm); benzo(b)fluoranthene at concentrations up to 49 ppm (USCO 1 ppm); benzo(k)fluoranthene at concentrations up to 19 ppm (USCO 0.8 ppm); chrysene at concentrations up to 41 ppm (USCO 1 ppm); dibenzo(a,h)anthracene at concentrations up to 6 ppm (USCO 0.33 ppm); and indeno(1,2,3-cd)pyrene at concentrations up to 17 ppm (USCO 0.5 ppm). Metals detected in subsurface soils include arsenic at concentrations up to 30.3 ppm (USCO 13 ppm); barium at concentrations up to 958 ppm (USCO 350 ppm); chromium at concentrations up to 224 ppm (USCO 30 ppm); copper at concentrations up to 141 ppm (USCO 50 ppm); lead at concentrations up to 2,570 ppm (USCO 63 ppm); mercury at concentrations up to 0.52 ppm (USCO 0.18 ppm); nickel at concentrations up to 300 ppm (USCO 30 ppm); and zinc at concentrations up to 315 ppm (USCO 109 ppm). PCBs were detected in subsurface soils in concentrations up to 3.5 ppm (USCO 0.1 ppm). Pesticides and herbicides detected in subsurface soils include 4,4'-DDD at concentrations up to 0.016 ppm (USCO 0.0033 ppm); 4,4'-DDE at concentrations up to 0.021 ppm (USCO 0.0033 ppm);

MT. OLIVE SENIOR MANOR SITE (Continued) **S127750702**

4,4'-DDT at concentrations up to 0.07 ppm (0.0033 ppm); and dieldrin at concentrations up to 0.0065 ppm (USCO 0.005 ppm). Perfluorooctanoic acid (PFOA) was detected at concentrations up to 1 ppb (unrestricted use guidance value 0.66 ppb), and PFOS was detected at concentrations up to 11 ppb (unrestricted use guidance value 0.88 ppb). Groundwater: Groundwater samples were analyzed for VOCs, SVOCs, metals, pesticides/herbicides, PCBs, and emergent contaminants. Samples were evaluated against the NYS Groundwater Quality Standards (GWQS). No exceedances of GWQS for SVOCs, herbicides, or PCBs were identified. VOCs detected in groundwater include cis-1,2-dichloroethene at concentrations up to 40 ppb (GWQS 5 ppb) and trichloroethene at concentrations up to 210 ppb (GWQS 5 ppb). Metals detected in groundwater include antimony at concentrations up to 6.8 ppb (GWQS 3 ppb); cobalt at concentrations up to 11 ppb (GWQS 5 ppb); and sodium at concentrations up to 39,200 ppb (GWQS 20,000 ppb). Samples were filtered due to turbidity; therefore, cobalt and antimony concentrations are not representative of stable groundwater conditions on site. Elevated sodium concentration in groundwater is likely due to road salt. The pesticide beta-BHC was detected in groundwater at a concentration of 0.026 ppb (GWQS 0.01 ppb). PFOA was detected at concentrations up to 75 ppt (guidance value 6.7 ppt) and PFOS at concentrations up to 390 ppt (guidance value 2.7 ppt) . Data does not indicate any off-site impacts in groundwater emanating from the site. The potential for the migration of VOCs and PFAS from an adjacent offsite source onto the site will be explored in the PDI. Soil Vapor: Soil vapor studies included the collection and testing of soil vapor samples from three locations within the planned footprint of the building to be constructed on the site. Samples were analyzed for VOCs. VOCs detected in soil vapor on site include tetrachloroethene (PCE) at concentration of 3.2 micrograms per cubic meter and trichloroethene (TCE) at concentrations up to 0.71 micrograms per cubic meter.

Health Problem: People will not come into contact with contaminated soil or groundwater unless they dig below the surface. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in soil vapor (air spaces within the soil) may move into buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern. However, future development on-site will be evaluated for soil vapor intrusion. A separate off-site and upgradient investigation is ongoing and will provide more information as to potential exposure via upgradient sources.

Name:	MT. OLIVE SENIOR MANOR SITE
Address:	703 EAST DELAVAN AVENUE
City,State,Zip:	BUFFALO, NY 14215
Site Code:	618622
HW Code:	C915377
Program:	BCP
Class Code:	A
Region:	9
Acres:	1.300
Date Record Added:	04/30/2021
Date Record Updated:	05/10/2023
Water Quantity:	UNKNOWN
Updated By:	AECAPRIO
Site Description:	Location: The Mt. Olive Senior Manor site is an approximately 1.3-acre site located in a highly developed urban area at 703 East Delavan Avenue in the City of Buffalo, Erie County. The other portion of the 2.63-acre parcel at 703 East Delevan Avenue is not part of the BCP site. The site is at the southeast corner of East Delavan and Sheridan Avenues. It is bordered by the remaining portion of 703 East Delavan to the north, commercial and industrial properties to the south, an industrial property to the west and Sheridan Avenue to the east. Site Features: The site consists of a grass covered athletic field and a small portion of an adjacent asphalt parking lot to the north. Zoning and Land Use: The current zoning for the Site is N-3R (Residential), defined as moderately compact residential blocks, which occasionally include small mixed-use buildings. The site is currently a grass covered athletic field. The redevelopment plan for the site is a 3-story affordable housing development for seniors, consistent with the zoning assigned to the site. Past Use of the Site: The 703 East Delavan parcel which includes this site has historically been developed with a church building, an associated parking lot and an athletic field. Historic fuel oil and gasoline storage tanks were identified in close proximity to the site along with historic automobile repair and rug/furniture cleaning, possibly with dry-cleaning operations, which were identified adjacent to the site. Site Geology and Hydrogeology: Previous investigation identified the site geology as primarily vegetative topsoil cover over varying types of fill materials ranging in depth from 3 inches to 2 feet below ground surface (fbgs) underlain by silty sand and/or fine sand in some locations. The site is situated over the Onondaga Formation. The Onondaga Formation is comprised of a limestone of varying texture, from coarse to very finely crystalline, with a dark gray to tan color and chert and fossils within. The unit has an approximate thickness of 150 feet. The depth to bedrock was identified at approximately 2 to 6 fbgs. The site is located within the Lake Erie-Niagara River major drainage basin, which is typified by little topographic relief that gently slopes westward towards Lake Erie and the Niagara River, except in the immediate vicinity of major drainage ways. Regionally, groundwater is expected to flow westerly

MT. OLIVE SENIOR MANOR SITE (Continued) **S127750702**

towards the Niagara River. Locally, groundwater was not encountered during previous investigations in the site overburden. Groundwater is present in the underlying bedrock at the site and flows to the west.

Summary: People will not come into contact with contaminated soil or groundwater unless they dig below the surface. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. Volatile organic compounds in soil vapor (air spaces within the soil) may move into buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Because the site is vacant, the inhalation of site-related contaminants due to soil vapor intrusion does not represent a current concern. However, future development on-site will be evaluated for soil vapor intrusion. A separate off-site and upgradient investigation is ongoing and will provide more information as to potential exposure via upgradient sources.

Summary: Soil and groundwater were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, polychlorinated biphenyls (PCBs), herbicides/pesticides, and per- and polyfluoroalkyl substances (PFAS). Soil vapor was analyzed for VOCs. The primary contaminants of concern are VOCs, SVOCs, herbicides/pesticides and emerging contaminants above unrestricted soil cleanup objectives (USCOs) as follows. Surface Soils: Surface soils were sampled from 0-2 inches below ground surface (bgs) and analyzed for SVOCs, metals, PCBs, herbicides/pesticides, and emerging contaminants. SVOCs detected in surface soil samples included benzo(a)anthracene at concentrations up to 8 parts per million (ppm) (USCO 1 ppm), benzo(a)pyrene at concentrations up to 8.4 ppm (USCO 1.0 ppm); benzo(b)fluoranthene at concentrations up to 9.6 ppm (USCO 1 ppm); benzo(k)fluoranthene at concentrations up to 3.7 ppm (USCO 0.8 ppm); chrysene at concentrations up to 7 ppm (USCO 1 ppm); dibenzo(a,h)anthracene at concentrations up to 1.3 ppm (USCO 0.33 ppm); and indeno(1,2,3-cd)pyrene at concentrations up to 4.4 ppm (USCO 0.5 ppm). Metals detected in surface soil samples included lead at concentrations up to 105 ppm (USCO 63 ppm); mercury at concentrations up to 0.2 ppm (USCO 0.18 ppm); chromium at concentrations up to 72.3 ppm (USCO 30 ppm); copper at concentrations up to 74 ppm (USCO 50 ppm); nickel at concentrations up to 205 ppm (USCO 30 ppm); and zinc at concentrations up to 144 ppm (USCO 109 ppm). PCBs were detected at concentrations up to 0.23 ppm (USCO 0.1 ppm) USCOs. Perfluorooctanesulfonic acid (PFOS) was detected in surface soil at concentrations up to 3.1 ppb (unrestricted use guidance value 0.88 parts per billion [ppb]). PFOA was not detected. Pesticides and herbicides detected in surface soil samples include 4,4'-DDE at concentrations up to 0.01 ppm (USCO 0.0033 ppm) and 4,4'-DDT at concentrations up to 0.015 ppm (USCO 0.0033 ppm). Data does not indicate any off-site impacts in surface soil emanating from the site. Subsurface soils: Subsurface soils were sampled from 2 inches to 3 feet bgs and analyzed for volatile organic compounds (VOCs), SVOCs, metals, herbicides/pesticides, PCBs and emerging contaminants. There were no exceedances of USCOs for VOCs identified in these samples. SVOCs detected in subsurface soils include benzo(a)anthracene at concentrations up to 41 ppm (USCO 1 ppm);

MT. OLIVE SENIOR MANOR SITE (Continued) **S127750702**

benzo(a)pyrene at concentrations up to 40 ppm (USCO 1 ppm); benzo(b)fluoranthene at concentrations up to 49 ppm (USCO 1 ppm); benzo(k)fluoranthene at concentrations up to 19 ppm (USCO 0.8 ppm); chrysene at concentrations up to 41 ppm (USCO 1 ppm); dibenzo(a,h)anthracene at concentrations up to 6 ppm (USCO 0.33 ppm); and indeno(1,2,3-cd)pyrene at concentrations up to 17 ppm (USCO 0.5 ppm). Metals detected in subsurface soils include arsenic at concentrations up to 30.3 ppm (USCO 13 ppm); barium at concentrations up to 958 ppm (USCO 350 ppm); chromium at concentrations up to 224 ppm (USCO 30 ppm); copper at concentrations up to 141 ppm (USCO 50 ppm); lead at concentrations up to 2,570 ppm (USCO 63 ppm); mercury at concentrations up to 0.52 ppm (USCO 0.18 ppm); nickel at concentrations up to 300 ppm (USCO 30 ppm); and zinc at concentrations up to 315 ppm (USCO 109 ppm). PCBs were detected in subsurface soils in concentrations up to 3.5 ppm (USCO 0.1 ppm). Pesticides and herbicides detected in subsurface soils include 4,4'-DDD at concentrations up to 0.016 ppm (USCO 0.0033 ppm); 4,4'-DDE at concentrations up to 0.021 ppm (USCO 0.0033 ppm); 4,4'-DDT at concentrations up to 0.07 ppm (0.0033 ppm); and dieldrin at concentrations up to 0.0065 ppm (USCO 0.005 ppm). Perfluorooctanoic acid (PFOA) was detected at concentrations up to 1 ppb (unrestricted use guidance value 0.66 ppb), and PFOS was detected at concentrations up to 11 ppb (unrestricted use guidance value 0.88 ppb). Groundwater: Groundwater samples were analyzed for VOCs, SVOCs, metals, pesticides/herbicides, PCBs, and emergent contaminants. Samples were evaluated against the NYS Groundwater Quality Standards (GWQS). No exceedances of GWQS for SVOCs, herbicides, or PCBs were identified. VOCs detected in groundwater include cis-1,2-dichloroethene at concentrations up to 40 ppb (GWQS 5 ppb) and trichloroethene at concentrations up to 210 ppb (GWQS 5 ppb). Metals detected in groundwater include antimony at concentrations up to 6.8 ppb (GWQS 3 ppb); cobalt at concentrations up to 11 ppb (GWQS 5 ppb); and sodium at concentrations up to 39,200 ppb (GWQS 20,000 ppb). Samples were filtered due to turbidity; therefore, cobalt and antimony concentrations are not representative of stable groundwater conditions on site. Elevated sodium concentration in groundwater is likely due to road salt. The pesticide beta-BHC was detected in groundwater at a concentration of 0.026 ppb (GWQS 0.01 ppb). PFOA was detected at concentrations up to 75 ppt (guidance value 6.7 ppt) and PFOS at concentrations up to 390 ppt (guidance value 2.7 ppt) . Data does not indicate any off-site impacts in groundwater emanating from the site. The potential for the migration of VOCs and PFAS from an adjacent offsite source onto the site will be explored in the PDI. Soil Vapor: Soil vapor studies included the collection and testing of soil vapor samples from three locations within the planned footprint of the building to be constructed on the site. Samples were analyzed for VOCs. VOCs detected in soil vapor on site include tetrachloroethene (PCE) at concentration of 3.2 micrograms per cubic meter and trichloroethene (TCE) at concentrations up to 0.71 micrograms per cubic meter.

Feature Description: On 5/7/1952, the Government purchased 7.65 acres fee from the Curtiss-Wright Corporation. On 5/21/1952, the Government purchased 0.24 of an acre easement from the Curtiss-Wright Corporation. The easement was for a right-of way for a railroad spur. On 6/24/1965, Air Force Plant No. 49 was declared excess to the needs of the US Air Force. By letter dated 3/28/1966, from the Secretary of the Air Force, the installation was reinstated into the Air Force Real Estate Inventory. On 6/2/1980, GSA accepted care and custody of Air Force Plant No. 49. By quitclaim deed dated 12/21/1983, 7.65 acres fee and 0.24 acre easement were conveyed to the Curtiss-Wright Corporation. There were no restrictive, restoration or recapture clauses in the deed. By bargain and Sale Deed dated 21/21/1983, Curtiss-Wright Corporation conveyed 7.65 acres fee and 0.24 acres easement were conveyed to the Erie County Industrial Development Agency (ECIDA).

DEC Memo:	Prior to Sept, 2004 data translation this spill Lead_DEC Field was SAC 10/9/98:RECEIVED SUBSURFACE INVESTIGATION REPORT FOR AREA OF OFORMER FUEL OIL AND GASOLINE TANKS. 4/27/99 - KAB/GARY KLAWINSKI, GZA/TELECON - FORWARDING REPORT ON ASSESSMENT OF TANKS ON PROPERTY TODAY. REQUESTS MEETING TO DISCUSS REMEDIATION PLAN. 6/21/99:SAC MET

CURTISS WRIGHT CORPORATION (Continued) **1000413812**

W/GARY KLAWINSKI - GZA, MR. KLAWINSKI SHOWED RESULTS OF ADDITIONAL GEOPROBE STUDY THAT WAS DONE AS A RESULT OF SUBSURFACE INVESTIGATION WORK THAT WAS COMPLETED LAST YEAR, DISCUSSED PROJECT, SAC TO REVIEW REPORTS AND DISCUSS W/RNL, REQUIREMENTS BASED ON REPORTS. 6/21/99:SAC DISCUSS SITE W/RNL, TANK 4 AREA - (2)- 11,250 GALLON FUEL OIL TANKS REQUESTED TO BE CLOSED IN PLACE, TEST PIT SAMPLE RESULTS FROM RIGHT NEXT TO THE TANKS USING TCLP 8021 & 8270 TO ANALYZE SAMPLES SHOW ONLY PARAMETER ABOVE STARS IS BENZENE AT 1.4 ppb, THEREFORE TANKS CAN BE CLOSED IN PLACE AND NO FURTHER WORK REQUIRED IN AREA, TANK 5 AREA - (1) - 350 GALLON GASOLINE TANK, CONTAMINATED SOIL AROUND THE TANK WILL BE REMOVED AND SINCE TANK WAS INSTALLED INTO THE BEDROCK ONLY SIDE WALL SAMPLES WILL BE REQUIRED, TANK 1 AREA - FORMER LOCATION OF (1) - 200 GALLON GASOLINE TANK, CONTAMINATED SOIL IN THE AREA MUST BE REMOVED, AND ONCE THE CONTAMINATED SOIL HAS BEEN REMOVED THEY MUST SAMPLE THE SOIL TO CONFIRM THE CLEANUP AND INSTALL A WELL AT THE SITE TO MAKE SURE GW NO LONGER AFFECTED, ADDITIONAL WORK IS REQUIRED AROUND THE TANK 2 AREA BECAUSE OF THE OIL DROPLETS FOUND IN THE WELL INSTALLED FROM GP-3 AND FOR THE TANK 3 AREA MORE WORK IS REQUIRED BASED ON THE SOIL LEVELS FOUND FROM GP-22. 6/22/99:SAC MET W/GARY KLAWINSKI - GZA, BILL SCHMIDT AND JAMES THARP - WYMAN GORDON, DISCUSSED REQUIREMENTS FOR THE SITE, TANK AREAS 1, 4, & 5 DISCUSSED AND AGREED UPON AS STATED IN ABOVE HISTORY NOTE DATED 6/21/99, TANK 2 & 3 AREA DISCUSSED, SAC STATED BASED ON DISCUSSIONS W/RNL THAT MORE WORK IS REQUIRED IN THESE AREAS, MR. KLAWINSKI SAID IT WILLL BE IMPOSSIBLE TO EXCAVATE IN THIS AREA DUE TO THE PRESENCE OF THE TRANSFORMERS AND THE UTILITY LINES AT THIS LOCATION, FOR THE OIL DROPLETS FOUND IN GP-3 THEY PROPOSED TO BAIL THE WELL TO SEE IF THEY COULD REMOVE THE PRODUCT FROM THE WELL IN THIS MANNER, SAC INDICATED THAT WAS OK TO TRY FIRST, ALSO ALTHOUGH IT IS ALWAYS RECOMMENDED TO REMOVE UNDERGROUND STORAGE TANKS, THE (2) 20,000 GALLON FUEL OIL TANKS WHICH WERE FILLED BUT THE FILLED MATERIAL HAD NOW SETTLED COULD BE FILLED AGAIN BUT THE CONTAMINATION WOULD HAVE TO BE ADDRESSED, FOR GP-22 A TCLP SAMPLE COULD BE TAKEN TO ADDRESS THIS AREA, IT WAS AGREED THAT SAC WOULD SEND A LETTER REQUESTING A WORKPLAN BY JULY 30TH. 6/24/99:SAC REVIEWED REPORTS AGAIN AND FOUND THAT TP-2 ANALYTICAL RESULTS HAD ELEVATED LEVELS THAT WERE NOT DISCUSSED W/RNL OR AT THE MEETING, SAC TELECON GARY KLAWINSKI - GZA REGARDING THESE LEVELS, IT WAS AGREED THAT THE RESAMPLING OF GP-22 AREA AND REANALYZED USING TCLP METHOD SHOULD BE POSTPONED UNTIL A MEETING WAS SETUP TO FURTHER EVALUATE THE AREA, TENTATIVELY SET UP A MEETING FOR 7/2/99. 7/2/99:RNL, SAC MET WITH GARY KLAWINSKI - GZA, BILL SCHMIDT & TOM NICHOLS - WYMAN GORDON, INSPECTED TANK AREA 1, 2 & 3, RNL REQUIRES FURTHER WORK IN TANK 3 AREA BASED ON SAMPLE RESULT LEVELS, DISCUSSED REMEDIAL OPTION FOR TANK 3 AREA WHICH IS TP-2 & GP-22 AREA, MR. GLAWINSKI SAID THEY WILL PROBABLY TRY TO INTRODUCE OXYGEN RELEASING COMPOUNDS TO THE AREA TO REMEDIATE THIS AREA, THEY WILL STILL SUBMIT A WORKPLAN BY JULY 31ST. 7/6/99:SAC DRAFTED LETTER REQUIRING WORKPLAN BY 7/31/99. 7/19/99:RECEIVED WORKPLAN FROM GZA. 7/26/99:DRAFTED COMMENT LETTER TO BILL SCHMIDT - WYMAN GORDON, INC., REQUIRING GROUNDWATER SAMPLED AT TANK AREA NO.1, TANK AREA 5 MUST HAVE SIDE WALLS SAMPLED IN THE OVERBURDEN, AND A BORING LOCATION MAP FOR THE ORC INJECTION POINTS AT AREA TP-2 & GP-22. 7/28/99:RECEIVED A FAXED COPY OF THE BORING LOCATION MAP FOR ORC INJECTION. 8/24/99:SAC INSPECT SITE AND MET W/GARY KLAWINSKI, JASON KELLY, & DAN TROY - GZA, TANK 5 AREA HAD TANK REMOVED, CONTAMINATED SOIL WAS STAGED ON SITE, SMALL AMOUNT OF WATER NOTED W/SLIGHT SHEEN, THEY WILL PUMP THE WATER INTO THE BIO CELL, HAND DIG OUT THE REMAINING AREAS OF CONTAMINATION

CURTISS WRIGHT CORPORATION (Continued) **1000413812**

TAKE SIDE WALL SAMPLES AND INSTALL WELL, TANK 4 AREA AND THE TANK 2 AREA WERE BEING FILLED IN WITH FLOWABLE FILL, TANK 1 AREA WAS EXCAVATED, THEY DID NOT WANT TO DIG INTO THE ROAD BECAUSE THE ROAD HAD 8 INCHES TO 1 FOOT OF REINFORCED CONCRETE, THEY ARE GOING TO CONTINUE TO EXCAVATE THE AREA, ONCE COMPLETED THEY AREA GOING TO TAKE SAMPLES AND INSTALL A WELL, THEY MAY NOT BE ABLE TO SAMPLE THE BOTTOM SINCE THEY ARE SO CLOSE TO EXCAVATING TO BEDROCK, THEY WILL ALSO PLACE ORCs INTO THE EXCAVATION TO TRY AND REMOVE ANY RESIDUAL CONTAMINATION THAT REMAINS, THE EXCAVATION HAD SOME GROUNDWATER WITH SHEEN, THEY ARE IN THE PROCESS OF SETTING UP THE BIOCELL, THEY INJECTED THE ORCs PREVIOUSLY IN THE GP-22/TP-2/TANK 3 AREA, PER MR. KLAWINSKI THEY STARTED TO BAIL THE WELL GP-3 TO REMOVE THE OIL DROPLETS OF PRODUCT SINCE THE INITIAL MEETING AND THIS PROCEDURE HAS BEEN ONGOING, THE AMOUNT OF OIL RECOVERED HAS DECREASED WITH THE BAILINGS, THEY HAVE FIVE DAY TURNAROUND FOR THE ANALYTICAL RESULTS AND ARE USING PARADIGM LABS FOR ALL ANALYSES, THEY WILL ISSUE THE REPORT ON TEH COMPLETED WORK IN THE NEXT FEW WEEKS, THEY ARE NOT GOING TO SAMPLE THE GP-22/TP-2/TANK 3 FOR AT LEAST A FEW MONTHS SO THIS WILL NOT BE PART OF THE REPORT. 11/18/99:RNL, SAC MET W/GARY KLAWINSKI - GZA, BILL SCHMIDT AND JIM THARPE, IXP - WYMAN GORDON, MR. KLAWINSKI WILL SUBMIT A PROGRESS REPORT AND INCLUDE AN EXPOSURE ASSESSMENT BASED ON THE WORK DONE. 2/3/00:SAC TELECON GARY KLAWINSKI - THEY HAVE TAKEN THE AIR SAMPLES AND THE SOIL GAS SURVEY SAMPLES AND ARE WAITING FOR THE RESULTS, WILL BE SENDING A REPORT TO DEC IN THE NEXT FEW WEEKS. 7/5/01:SAC MET W/GARY KLAWINSKI TO DISCUSS SITE, MR. KLAWINSKI HAS DONE ADDITIONAL SAMPLING AND WILL SUBMIT A REPORT NEXT WEEK AND REQUEST NO FURTHER ACTION ON SITE. 10/11/01:RECEIVED REMEDIAL ACTION CLOSURE REPORT FROM GZA, OUTLINING ALL WORK THAT WAS DONE INCLUDING ALL REPORTS THAT WERE PUT TOGETHER. 10/?/01:SAC REVIEWED CLOSURE REPORT W/DKK, ALTHOUGH TAGM 4046 GUIDANCE VALUES WERE EXCEEDED AT TANK AREA 1 AND TANK AREA 3 (GP-22), NO FURTHER WORK WILL BE REQUIRED SINCE THE SITE WILL REMAIN INDUSTRIAL, FURTHER EXCAVATION OF THE SOIL WOULD NOT BE FEASIBLE DUE TO ON-SITE STRUCTURES AND UTILITIES, THERE IS NOT SIGNIFICANT CONTAMINANT MIGRATION VIA THE GROUNDWATER, THERE APPEARS TO BE NO CONTAMINATION THAT HAS MIGRATED TO SOIL OFF-SITE, BASED ON THE SAMPLE RESULTS BIOTREATMENT OF THE SOIL HAS BEEN COMPLETED AND IT WILL BE USED ON-SITE AS FILL (PENDING AN INSPECTION OF THE SOIL IN THE BIOCELL), SITE WILL BE GIVEN INACTIVE STATUS. 11/19/01:SAC INSPECT BIOCELL W/GARY KLAWINSKI - GZA AND BILL SCHMIDT - WYMAN GORDON/IXP, LARGE AMOUNT OF VEGETATION GROWING OUT OF SOIL IN BIOCELL, PER MR. KLAWINSKI SOIL WAS NOT TILLED BUT TURNED USING AN EXCAVATOR, SAC EXAMINED 4 TO 5 SOIL SAMPLES ABOUT 1 FT INTO THE CELL, NO ODORS WERE APPARENT IN THE SAMPLES TAKEN. 11/21/01:DRAFTED I LETTER.

Remarks: GROUNDWATER CONTAMINATION FOUND DOWN GRADIENT FROM FORMER TANK REMOVAL EXCAVATION.(SPILL #9309900)

473 EAST DELEVAN INC. (Continued) **S100493723**

DER Facility ID: 258510
DEC Memo: Prior to Sept, 2004 data translation this spill Lead_DEC Field was
RNL 12/05/96: RMC/GREGG WEBBER/PHONE MNP SPILL UNABLE TO CONTACT, DIGGING BEGUN 12/4 . AREA OF CONTAMINATION LARGER THAN EXPECTED, WANT DEC TO INSPECT, REMOVED SOIL IN 12 BY 20 BY 10 FOOT AREA. 12/5/96 RMC/NATURES WAY/SITE AREA OF CONTAMINATION APPEARS TO BE MUCH DEEPER THAN IDENTIFIED IN SOIL BORINGS, CONTAMINATION HAS PENETRATED SEVERAL FEET INTO VIRGIN SIOL. ESTIMATE EXCAVATION 10 PERCENT COMPLETE WITH 75 TONS ALREADY REMOVED. 12/6/96 RMC/WEBBER/PHONE RP WAS ADVISED BY NATURES WAY OF ADDITIONAL SCOPE OF WORK REQUIRED, NATURES WAY TO CONTACT MNP WITH SITE PLANS BY 12/13/96. 12/18/96: MNP INSP. EXCAVATION IN FRONT OF BUILDING, NEARLY FILLED W/ WATER & HAS A FILM OF OIL PRODUCT ON THE SURFACE. CONTAMINATED SOIL PILE STAGED ON PLASTIC ON WEST SIDE OF BLDG. 12/27/96: MNP TELECON W/ TOM WOELFE - NATURE'S WAY. THEY STARTED DIGGING WEST OF CURRENT EXCAVATION WHICH IS NEARLY FILLED W/ WATER. WORK TO CONTINUE TOMORROW (SATURDAY) & 12/30/96 (MON.), BIO-PILE WILL BE CONSTRUCTED FOR CONTAMINATED SOIL & WATER TO BE PUMPED INTO TEMPORARY TANKS UNTIL SAMPLED & DISCHARGE APPROVED BY BSA. MNP TO INSP. MON. PM. 12/30/96: MNP INSP. MET W/ TOM WOELFE - NATURE'S WAY. OVER 500 YDS. GASOLINE CONTAM. SOIL ALREADY EXCAVATED. BOTTOM OF EAST EXCAVATION DOWN TO BEDROCK & APPEARS TO BE OK. HOWEVER, SOIL ALONG SOUTH SIDE OF EXCAVTION TOARD STREET STILL HAS STRONG GASOLINE ODOR. WATER BEING PUMPED FROM MIDDLE EXCAVATION INTO TANKER, THEN FILTERED THROUGH CARBON DRUM INTO TANK ON SITE. SAMPLES OF FILTERED WATER TAKEN FOR ANALYSIS BEFORE DISCHARGING. MORE EXCAATION TO BE DONE IN MIDDLE EXCAVATION. SAMPLES TO BE COLLECTED FROM BOTTOM & SIDES, 3 & 7 RESPECTIVELY. MW'S WILL BE REQUIRED BECAUSE OF GASOLINE PRODUCT STILL SEEPING INTO EXCAV. FROM UNDER BUILDING. ALSO, MW'S MAY B NEEDED ALONG SOUTH SIDE OF EXCAVATION, IF ADDITIONAL SOIL IS NOT REMOVED. ALSO, FURTHER SITE ASSESSMENT MAY BE REQUIRED. SOIL BEING STAGED ON HAY & PLASTIC 2-3 FT DEEP FOR BIOREMEDIATION. 01/06/96: MNP TELECON W/ GREG WEBER - NWI. SEVERAL HUNDRED YARDS OF GASOLINE CONTAMINATED SOIL EXCAVATED BETWEEN BUILDING & E. FERRY ST. 2 TRUCKLOADS OF CONTAMINATED SOIL TAKEN TO 56 CLYDE ST, BUFFALO (PROPERTY OWNED BY INDUSTRIAL REALTY & FUNDING). WEBER SAID BOTTOM & SIDE SAMPLES COLLECTED & BEING SENT TO EXPRESS LAB FOR ANALYSIS. EXCAVATION BACKFILLED, NO MW'S INSTALLED AS I HAD DISCUSSED W/ TOM WOELFE. I EXPLAINED MY CONCERNS THAT A MW (OR MW'S) MAY BE NEEDED BECAUSE OF THE PRODUCT SEEPING INTO THE EXCAVATION FROM UNDER THE BUILDING ON THE NORTH SIDE. 01/06/96: MNP TELECON W/ TED KOSIOREK - INDUSTRIAL REALTY & FUNDING, INC., PO BOX 1011, BUFFALO, NY 14240, PH# (716)895-1880. HIS COMPANY IS FINANCING THE CLEANUP BY NATURE'S WAY. KOSIOREK SAID IR&F SOLD THE THE PROPERTY TO MIKE ABUHAMRA 3 YEARS AGO. THEY PLAN TO SETTLE COSTS BETWEEN THEM, MDM PETROLEUM & ABUHAMRA. I WILL CC CORRESPONDENCE TO IR&F & NWI. 10/02/97: MNP REVIEWED SAMPLE RESULTS FOR BIO-REMEDIATION PILES. SOME VOLATILES DETECTED, BUT ALL WERE BELOW STARS #1. SITE NEEDS TO BE INSPECTED BEFORE CLOSURE. 11/05/97: MNP INSP. CHECKED SOIL PILE BEHIND BUILDING. GASOLINE ODORS NOTED IN WEST END OF PILE, REST OF PILE OK. ALSO, CHECKED SOIL AT 56 CLYDE AVE SITE, NO ODORS NOTED. 11/30/97: RNL INSPECTION, DUG SEVERAL LOCATIONS, NO ODORS OR SHEENS NOTED, BASED ON SAMPLE RESULTS, CLOSEOUT 02/19/98: RNL NOTE, MNP SENT CLOSURE LETTER TO MIKE ABUHAMRA 05/30/98: RNL UPDATE, RECIEVED QUERY FROM CITY ABOUT SOIL ON SITE, I CHECKED FILE AND FOUND IT NOT TO BE CLOSED, CLOSED FILE, SENT LETTER TO CITY ABOUT SOIL, COULD STAY ON SITE OR BE REUSED, MET OUR SOIL GUIDANCE VALUES
Remarks: SOIL BORINGS INDICATE CONTAMINATION.

Site Description:	Site Location: The 1827 Fillmore Avenue site is an approximately 17.1-acre site located in an urban area at 1827 Fillmore Ave in the City of Buffalo, Erie County. It is bounded by the Kensington Expressway (Route 33) and Buffalo Public School #84 to the north, Erie County Medical Center (ECMC) to the east, Buffalo Public School #89 to the south and Fillmore Avenue to the west. Site Features: The site is mainly vacant land with green areas, asphalt-paved parking lots and roadways. The entire site is enclosed by fence. A portion of the site is used as parking for ECMC. Current Zoning and Land Use: The site is zoned D-C Flex Commercial and is vacant except for a portion of the site being used for parking. Past Use of the Site: From at least 1917 the site was part of a stone quarry which encompassed the entire site and portions of adjacent properties to the east and south. Between the 1940s and the 1950s, the stone quarry was backfilled with sand, gravel, cinders, ash, asphalt, broken concrete, brick, metal debris, wood, glass and ceramics. The Kensington Heights Towers complex was constructed on-site in 1958. The complex consisted of six, seven-story brick apartment buildings, open space, and on-site parking. The site has been vacant since the 1980s. From 2009 to 2014, asbestos was removed from the apartment buildings and by 2018, all six buildings had been demolished. The site contamination is largely attributed to the waste fill materials used to backfill the stone quarry. Site Geology and Hydrogeology: The fill materials extend from the surface to the top of bedrock, varying in depths from 3 to 24 feet. Two soil mounds are located on-site, consisting mainly of topsoil, sandy clay and minimal fill. Groundwater was encountered within the fill material in the central and eastern portions of the site, at depths of approximately 14 to 18 feet, typically within a layer of ash. No groundwater was encountered within the fill in the western portion of the site. Bedrock wells installed in the western portion of the site found groundwater at depths of approximately 20 feet. Groundwater flows in a westerly direction.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals, including arsenic, barium, cadmium, copper, lead, mercury, manganese and sodium, and semi-volatile organic compounds (SVOCs) in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem:	Measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

Site Code: 482726
Site Description: Site Location: The 1827 Fillmore Avenue site is an approximately 17.1-acre site located in an urban area at 1827 Fillmore Ave in the City of Buffalo, Erie County. It is bounded by the Kensington Expressway (Route 33) and Buffalo Public School #84 to the north, Erie County Medical Center (ECMC) to the east, Buffalo Public School #89 to the south and Fillmore Avenue to the west. Site Features: The site is mainly vacant land with green areas, asphalt-paved parking lots and roadways. The entire site is enclosed by fence. A portion of the site is used as parking for ECMC. Current Zoning and Land Use: The site is zoned D-C Flex Commercial and is vacant except for a portion of the site being used for parking. Past Use of the Site: From at least 1917 the site was part of a stone quarry which encompassed the entire site and portions of adjacent properties to the east and south. Between the 1940s and the 1950s, the stone quarry was backfilled with sand, gravel, cinders, ash, asphalt, broken concrete, brick, metal debris, wood, glass and ceramics. The Kensington Heights Towers complex was constructed on-site in 1958. The complex consisted of six, seven-story brick apartment buildings, open space, and on-site parking. The site has been vacant since the 1980s. From 2009 to 2014, asbestos was removed from the apartment buildings and by 2018, all six buildings had been demolished. The site contamination is largely attributed to the waste fill materials used to backfill the stone quarry. Site Geology and Hydrogeology: The fill materials extend from the surface to the top of bedrock, varying in depths from 3 to 24 feet. Two soil mounds are located on-site,

1827 FILLMORE AVENUE (Continued) **S113916510**

consisting mainly of topsoil, sandy clay and minimal fill. Groundwater was encountered within the fill material in the central and eastern portions of the site, at depths of approximately 14 to 18 feet, typically within a layer of ash. No groundwater was encountered within the fill in the western portion of the site. Bedrock wells installed in the western portion of the site found groundwater at depths of approximately 20 feet. Groundwater flows in a westerly direction.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals, including arsenic, barium, cadmium, copper, lead, mercury, manganese and sodium, and semi-volatile organic compounds (SVOCs) in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.

Health Problem: Measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

Two soil mounds are located on-site, consisting mainly of topsoil, sandy clay and minimal fill. Groundwater was encountered within the fill material in the central and eastern portions of the site, at depths of approximately 14 to 18 feet, typically within a layer of ash. No groundwater was encountered within the fill in the western portion of the site. Bedrock wells installed in the western portion of the site found groundwater at depths of approximately 20 feet. Groundwater flows in a westerly direction.

Env Problem: Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals, including arsenic, barium, cadmium, copper, lead, mercury, manganese and sodium, and semi-volatile organic compounds (SVOCs) in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.

Health Problem: Measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

BROWNFIELDS:
Name: 1827 FILLMORE AVENUE
Address: 1827 FILLMORE AVENUE
City,State,Zip: BUFFALO, NY 14214
Program: BCP
Site Code: 482726
Acres: 17.110
HW Code: C915279
SWIS: 1502
Town: Buffalo (c)
Record Added Date: 06/03/2013
Record Updated Date: 04/25/2023
Update By: AECAPRIO
Site Description: Site Location: The 1827 Fillmore Avenue site is an approximately 17.1-acre site located in an urban area at 1827 Fillmore Ave in the City of Buffalo, Erie County. It is bounded by the Kensington Expressway (Route 33) and Buffalo Public School #84 to the north, Erie County Medical Center (ECMC) to the east, Buffalo Public School #89 to the south and Fillmore Avenue to the west. Site Features: The site is mainly vacant land with green areas, asphalt-paved parking lots and roadways. The entire site is enclosed by fence. A portion of

1827 FILLMORE AVENUE (Continued) **S113916510**

	the site is used as parking for ECMC. Current Zoning and Land Use: The site is zoned D-C Flex Commercial and is vacant except for a portion of the site being used for parking. Past Use of the Site: From at least 1917 the site was part of a stone quarry which encompassed the entire site and portions of adjacent properties to the east and south. Between the 1940s and the 1950s, the stone quarry was backfilled with sand, gravel, cinders, ash, asphalt, broken concrete, brick, metal debris, wood, glass and ceramics. The Kensington Heights Towers complex was constructed on-site in 1958. The complex consisted of six, seven-story brick apartment buildings, open space, and on-site parking. The site has been vacant since the 1980s. From 2009 to 2014, asbestos was removed from the apartment buildings and by 2018, all six buildings had been demolished. The site contamination is largely attributed to the waste fill materials used to backfill the stone quarry. Site Geology and Hydrogeology: The fill materials extend from the surface to the top of bedrock, varying in depths from 3 to 24 feet. Two soil mounds are located on-site, consisting mainly of topsoil, sandy clay and minimal fill. Groundwater was encountered within the fill material in the central and eastern portions of the site, at depths of approximately 14 to 18 feet, typically within a layer of ash. No groundwater was encountered within the fill in the western portion of the site. Bedrock wells installed in the western portion of the site found groundwater at depths of approximately 20 feet. Groundwater flows in a westerly direction.
Env Problem:	Remediation at the site is complete. Prior to remediation, the primary contaminants of concern were metals, including arsenic, barium, cadmium, copper, lead, mercury, manganese and sodium, and semi-volatile organic compounds (SVOCs) in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem:	Measures are in place to control the potential for coming in contact with residual contamination remaining at the site.

Record Add: 11/18/1999
Record Upd: 10/31/2022
Updated By: AECAPRIO
Site Description: Location: The 318 Urban Street site is an approximately 2.468-acre site located in a mixed residential/industrial area at 318 Urban Street in the City of Buffalo, Erie County. The site is bounded by residential homes to the north, Urban Street to the south, apartments and a playground to the east, and railroad tracks to the west. A public school is located diagonally across Urban Street to the southeast. Site Features: The site contains a brick/block high bay industrial building. Asphalt pavement borders the northern, eastern and western sides of the building. The remainder of the site is covered in turf grass. The entire parcel is secured with a chain link fence and driveway gate. The western side of the site is bounded by an elevated grade developed for the rail corridor. Current Zoning and Land Use: The site is zoned for Light Industrial use. Past Use of the Site: General Electric Corporation (GE) owned and operated the site from 1921 to 1968. GE used the building as a service shop to repair electrical equipment and transformers and to machine parts. A transformer pit was used for operations which included draining oil from transformers. Pyramid Steel Corporation (a.k.a. Sweeney Steel Service, Corp.) purchased the site in 1985 and used the building as a machine shop and warehouse for steel fabrication and supply. Pyramid vacated the property in the early 2000s. Several industrial tenants have used the building and site intermittently since that time. Site Geology and Hydrogeology: The surface soils consist primarily of poorly drained silts and clays. Based on the USGS topographic map, there are no surface water bodies within a one-mile radius of the site. The nearest surface water body shown on the map is Scajaquada Creek, which is one and one-half miles northwest of the site. Storm water runoff enters on-site catch basins and is directed through storm drains to a publicly owned combined storm and sanitary sewer on French Street. During normal flow conditions, the flow is discharged to the publicly-owned treatment works (POTW) on Squaw Island. During heavy storms, the combined sewer overflow discharges directly to Scajaquada Creek.
Env Problem: Remediation at the site is complete. Prior to remediation the primary contaminants of concern were PCBs in soil, groundwater and sewer sediments. Remedial activities have successfully achieved soil cleanup objectives for industrial use. Residual contamination in soil, groundwater and sewer sediments is being managed under a Site Management Plan.
Health Problem: Since the site is covered by asphalt, buildings, and clean backfill, people will not come in contact with site related soil or groundwater contamination that remains unless they dig below the surface. Groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. While the remaining extent of volatile organic compounds in soil is limited at the site, there is a process by which volatile organic compounds in soil may move into the soil vapor (air spaces within the soil), and in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Under current conditions and use of the site, soil vapor intrusion is not a concern, however, if use of the

GENERAL ELECTRIC - FORMER SHOP (Continued) **1000833429**

site changes from industrial use, the potential for soil vapor intrusion to occur will be evaluated.

Health Problem:	Since the site is covered by asphalt, buildings, and clean backfill, people will not come in contact with site related soil or groundwater contamination that remains unless they dig below the surface. Groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. While the remaining extent of volatile organic compounds in soil is limited at the site, there is a process by which volatile organic compounds in soil may move into the soil vapor (air spaces within the soil), and in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Under current conditions and use of the site, soil vapor intrusion is not a concern, however, if use of the site changes from industrial use, the potential for soil vapor intrusion to occur will be evaluated.

Control Type: INST
Dt record added: 06/18/2007
Dt rec updated: 01/30/2020
Updated By: MEKUCZKA
Site Code: 57878
Site Description: Location: The 318 Urban Street site is an approximately 2.468-acre site located in a mixed residential/industrial area at 318 Urban Street in the City of Buffalo, Erie County. The site is bounded by residential homes to the north, Urban Street to the south, apartments and a playground to the east, and railroad tracks to the west. A public school is located diagonally across Urban Street to the southeast. Site Features: The site contains a brick/block high bay industrial building. Asphalt pavement borders the northern, eastern and western sides of the building. The remainder of the site is covered in turf grass. The entire parcel is secured with a chain link fence and driveway gate. The western side of the site is bounded by an elevated grade developed for the rail corridor. Current Zoning and Land Use: The site is zoned for Light Industrial use. Past Use of the Site: General Electric Corporation (GE) owned and operated the site from 1921 to 1968. GE used the building as a service shop to repair electrical equipment and transformers and to machine parts. A transformer pit was used for operations which included draining oil from transformers. Pyramid Steel Corporation (a.k.a. Sweeney Steel Service, Corp.) purchased the site in 1985 and used the building as a

GENERAL ELECTRIC - FORMER SHOP (Continued) **1000833429**

machine shop and warehouse for steel fabrication and supply. Pyramid vacated the property in the early 2000s. Several industrial tenants have used the building and site intermittently since that time. Site Geology and Hydrogeology: The surface soils consist primarily of poorly drained silts and clays. Based on the USGS topographic map, there are no surface water bodies within a one-mile radius of the site. The nearest surface water body shown on the map is Scajaquada Creek, which is one and one-half miles northwest of the site. Storm water runoff enters on-site catch basins and is directed through storm drains to a publicly owned combined storm and sanitary sewer on French Street. During normal flow conditions, the flow is discharged to the publicly-owned treatment works (POTW) on Squaw Island. During heavy storms, the combined sewer overflow discharges directly to Scajaquada Creek.

Env Problem: Remediation at the site is complete. Prior to remediation the primary contaminants of concern were PCBs in soil, groundwater and sewer sediments. Remedial activities have successfully achieved soil cleanup objectives for industrial use. Residual contamination in soil, groundwater and sewer sediments is being managed under a Site Management Plan.

Health Problem: Since the site is covered by asphalt, buildings, and clean backfill, people will not come in contact with site related soil or groundwater contamination that remains unless they dig below the surface. Groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. While the remaining extent of volatile organic compounds in soil is limited at the site, there is a process by which volatile organic compounds in soil may move into the soil vapor (air spaces within the soil), and in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Under current conditions and use of the site, soil vapor intrusion is not a concern, however, if use of the site changes from industrial use, the potential for soil vapor intrusion to occur will be evaluated.

Site Geology and Hydrogeology: The surface soils consist primarily of poorly drained silts and clays. Based on the USGS topographic map, there are no surface water bodies within a one-mile radius of the site. The nearest surface water body shown on the map is Scajaquada Creek, which is one and one-half miles northwest of the site. Storm water runoff enters on-site catch basins and is directed through

GENERAL ELECTRIC - FORMER SHOP (Continued) **1000833429**

storm drains to a publicly owned combined storm and sanitary sewer on French Street. During normal flow conditions, the flow is discharged to the publicly-owned treatment works (POTW) on Squaw Island. During heavy storms, the combined sewer overflow discharges directly to Scajaquada Creek.

Env Problem: Remediation at the site is complete. Prior to remediation the primary contaminants of concern were PCBs in soil, groundwater and sewer sediments. Remedial activities have successfully achieved soil cleanup objectives for industrial use. Residual contamination in soil, groundwater and sewer sediments is being managed under a Site Management Plan.

Health Problem: Since the site is covered by asphalt, buildings, and clean backfill, people will not come in contact with site related soil or groundwater contamination that remains unless they dig below the surface. Groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination. While the remaining extent of volatile organic compounds in soil is limited at the site, there is a process by which volatile organic compounds in soil may move into the soil vapor (air spaces within the soil), and in turn may move into overlying buildings and affect the indoor air quality. This process, which is similar to the movement of radon gas from the subsurface into the indoor air of buildings, is referred to as soil vapor intrusion. Under current conditions and use of the site, soil vapor intrusion is not a concern, however, if use of the site changes from industrial use, the potential for soil vapor intrusion to occur will be evaluated.

Site Code: 57878
Site Description: Location: The 318 Urban Street site is an approximately 2.468-acre site located in a mixed residential/industrial area at 318 Urban Street in the City of Buffalo, Erie County. The site is bounded by residential homes to the north, Urban Street to the south, apartments and a playground to the east, and railroad tracks to the west. A public school is located diagonally across Urban Street to the southeast. Site Features: The site contains a brick/block high bay industrial building. Asphalt pavement borders the northern, eastern and western sides of the building. The remainder of the site is covered in turf grass. The entire parcel is secured with a chain link fence and driveway gate. The western side of the site is bounded by an elevated grade developed for the rail corridor. Current Zoning and Land Use: The site is zoned for Light Industrial use. Past Use of the Site: General Electric Corporation (GE) owned and operated the site from 1921 to 1968. GE used the building as a service shop to repair electrical equipment and transformers and to machine parts. A

GENERAL ELECTRIC - FORMER SHOP (Continued) **1000833429**

transformer pit was used for operations which included draining oil from transformers. Pyramid Steel Corporation (a.k.a. Sweeney Steel Service, Corp.) purchased the site in 1985 and used the building as a machine shop and warehouse for steel fabrication and supply. Pyramid vacated the property in the early 2000s. Several industrial tenants have used the building and site intermittently since that time. Site Geology and Hydrogeology: The surface soils consist primarily of poorly drained silts and clays. Based on the USGS topographic map, there are no surface water bodies within a one-mile radius of the site. The nearest surface water body shown on the map is Scajaquada Creek, which is one and one-half miles northwest of the site. Storm water runoff enters on-site catch basins and is directed through storm drains to a publicly owned combined storm and sanitary sewer on French Street. Environmental Interest/Information System:
The Resource Conservation and Recovery Act Information System (RCRAInfo) is EPA's comprehensive information system in support of the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. It tracks many types of information about generators, transporters, treaters, storers, and disposers of hazardous waste.

Updated By:	AECAPRIO
Site Description:	Location: The Niagara Mohawk Dewey Ave. Service Station is an approximately 21.20-acre site located in an urban area at 144 Kensington Avenue in the City of Buffalo, Erie County. St. Mary's School for the Deaf borders the site to the west. Site Features: A mechanic shop, several administrative buildings, a fuel island and an employee parking lot are currently located on site. Current Zoning and Land Use: The site is an active National Grid service center. Past Use of the Site: The site has been used for servicing electrical equipment since the early 1930s. Site Geology and Hydrogeology: Groundwater generally flows to the east across the site.
Env Problem:	Remediation at the site is complete. Prior to remediation the primary

NATIONAL GRID BARNS (Continued) **S106722172**

	contaminants of concern were polychlorinated biphenyls (PCBs) in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for commercial use. Residual contamination is soil and groundwater is being managed under a Site Management Plan.
Health Problem:	The majority of soil is covered with pavement and buildings and contact with any potentially contaminated soil is not likely. Contaminated groundwater at the site is not used for drinking or other purposes and the site is served by a public water supply that obtains water from a different source not affected by this contamination.

Waste Description: Not Defined

Waste Code: D001
Waste Description: Ignitable Waste

Waste Code: D002

NIAGARA MOHAWK POWER CORP A NATIONAL GRID CO - DEWEY AVE SER (Continued) **1015757885**

Waste Description: Corrosive Waste

Waste Code: D007
Waste Description: Chromium

Waste Code: D008
Waste Description: Lead

Waste Code: D009
Waste Description: Mercury

Waste Code: D018
Waste Description: Benzene

Waste Code: D019
Waste Description: Carbon Tetrachloride

Waste Code: D027
Waste Description: 1,4-Dichlorobenzene

Waste Code: D035
Waste Description: Methyl Ethyl Ketone

Waste Code: D039
Waste Description: Tetrachloroethylene

Waste Code: F001
Waste Description: The Following Spent Halogenated Solvents Used In Degreasing: Tetrachloroethylene, Trichlorethylene, Methylene Chloride, 1,1,1-Trichloroethane, Carbon Tetrachloride And Chlorinated Fluorocarbons; All Spent Solvent Mixtures/Blends Used In Degreasing Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F002
Waste Description: The Following Spent Halogenated Solvents: Tetrachloroethylene, Methylene Chloride, Trichloroethylene, 1,1,1-Trichloroethane, Chlorobenzene, 1,1,2-Trichloro-1,2,2-Trifluoroethane, Ortho-Dichlorobenzene, Trichlorofluoromethane, And 1,1,2, Trichloroethane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Halogenated Solvents Or Those Solvents Listed In F001, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: F003
Waste Description: The Following Spent Nonhalogenated Solvents: Xylene, Acetone, Ethyl Acetate, Ethyl Benzene, Ethyl Ether, Methyl Isobutyl Ketone, N-Butyl Alcohol, Cyclohexanone, And Methanol; All Spent Solvent Mixtures/Blends Containing, Before Use, Only The Above Spent Nonhalogenated Solvents; And All Spent Solvent Mixtures/Blends Containing, Before Use, One Or More Of The Above Nonhalogenated Solvents, And A Total Of Ten Percent Or More (By Volume) Of One Or More Of Those Solvents Listed In F001, F002, F004, And F005; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent

NIAGARA MOHAWK POWER CORP A NATIONAL GRID CO - DEWEY AVE SER (Continued) 1015757885

Mixtures.

Waste Code: F005
Waste Description: The Following Spent Nonhalogenated Solvents: Toluene, Methyl Ethyl Ketone, Carbon Disulfide, Isobutanol, Pyridine, Benzene, 2-Ethoxyethanol, And 2-Nitropropane; All Spent Solvent Mixtures/Blends Containing, Before Use, A Total Of Ten Percent Or More (By Volume) Of One Or More Of The Above Nonhalogenated Solvents Or Those Solvents Listed In F001, F002, Or F004; And Still Bottoms From The Recovery Of These Spent Solvents And Spent Solvent Mixtures.

Waste Code: LABP
Waste Description: Labp

Waste Code: NONE
Waste Description: None

Waste Code: U002
Waste Description: 2-Propanone (I) (Or) Acetone (I)

Waste Code: U075
Waste Description: Dichlorodifluoromethane (Or) Methane, Dichlorodifluoro-

Waste Code: U154
Waste Description: Methanol (I) (Or) Methyl Alcohol (I)

Waste Code: U159
Waste Description: 2-Butanone (I,T) (Or) Methyl Ethyl Ketone (Mek) (I,T)

Waste Code: U211
Waste Description: Carbon Tetrachloride (Or) Methane, Tetrachloro-

Waste Code: U239
Waste Description: Benzene, Dimethyl- (I,T) (Or) Xylene (I)

Name: AMERICAN AXLE PLANT
Address: 1001 EAST DELAVAN AVENUE
City,State,Zip: BUFFALO, NY 14215
Program: HW
Site Code: 346870
Classification: Significant threat to the public health or environment - action required.
Region: 9
Acres: 2.653
HW Code: 915196
Record Add: 06/01/2005
Record Upd: 09/22/2022
Updated By: AECAPRIO
Site Description: Location: The American Axle Plant site is a 2.654-acre portion of a former manufacturing facility located in an urban area at 1001 East Delavan Avenue in the City of Buffalo, Erie County. The site is near the intersection of East Delavan and Cornwall Avenues. Site Features: The site is a portion of a former automobile drivetrain manufacturing facility. The former plant complex also includes plant facilities located on non-contiguous parcels at 1057 East Delavan (3.43 acres) and at 320 Scajacuada Street (8.31 acre Saginaw Site - 915152). The adjoining parcel contains plant facilities consisting of on-grade structures and paved surfacing. The surface water body nearest the site is the Scajaquada Creek Drain. There is a portion of a 5x9 foot oval combined sewer which runs beneath the site. The sewer is constructed from brick and serves as a combined sewer for the Buffalo Sewer Authority (BSA) sewer system. Several of the existing plant building were constructed over the 5x9 sewer. Numerous sewer laterals connect to the 5x9 oval sewer beneath the facility. The 5x9 oval sewer empties into the BSA Scajaquada Interceptor (interceptor) south of the site, which flows west to the BSA Wastewater Treatment Facility. A combined sewer overflow relief point, referred to by the BSA as Sewer Patrol Point (SPP) 337, is present at the junction of the 5x9 oval sewer and a vertical shaft leading to the BSA interceptor. There is also a groundwater recovery and treatment system is in operation on the site. Current Zoning and Land Use: The site is zoned industrial and is not in active use. The nearest residence is approximately 700 feet west of the site. Past Use of the Site: The former manufacturing facility was operated by General Motors from the 1920s to 1994. Initially, automobiles were assembled, and later automobile drivetrain components were manufactured. The site, along with the balance of the property, adjoining parcels, and the axle manufacturing business was sold to American Axle in 1994.

SUBSTATION 7 - 2ND FLOOR OF THE POWERHOUSE (Continued) **S104497613**

American Axle ceased its manufacturing operations at this facility in 2008 and sold the property including this site and adjoining parcels to East Delavan Property, LLC (EDP) in September 2008. The 2.654-acre site was subdivided from the larger plant complex in 2017. A portion of the 1001 East Delevan parcel is occupied by a sister entity of EDP and several other tenants. Site investigations began in 1991 after the discovery of a petroleum spill in the former B-26 coolant pit, which contained metal working oil contaminated with polychlorinated biphenyls (PCBs). Initial investigations were centered around the B-26 cooling pit. Site Geology: The overburden ranges from 6.5 to 20.7 feet and consists of fill, clay and till units above bedrock. Fill: The fill layer thickness varies between 0.2 feet to 15.5 feet and is composed of reworked soil, crushed concrete, gravel, foundry slag, crushed brick, cinders, wood, and metal and glass fragments. The southern end of the 1001 East Delavan and 320 Scajaquada Street parcels previously contained a free flowing creek (Scajaquada Creek) before being filled and relocated as a tunnel south of the site along Scajaquada Street (referred to as the Scajaquada Creek Drain). Clay: The clay layer consists of gray or black silt/clay in the upper horizon and red-brown clay in the lower horizon. The average thickness of the upper silt/clay is 2.4 feet and the average thickness of the red-brown clay is 8.5 feet. Till: The till is intermittently present overlying the bedrock. The average thickness of the till is 1.4 feet. Bedrock: The average depth to bedrock beneath the site is approximately 15.8 feet below ground surface. The bedrock consists of light to dark gray cherty limestone (Onondaga Limestone). Site Hydrogeology: Subsurface features beneath the 1001 East Delavan manufacturing plant influence groundwater flow, especially in the fill and upper clay layers. The primary influencing features are the 5X9 oval combined sewer and the former B-26 coolant pit. The groundwater/oil collection system installed in 2019 further depresses shallow groundwater around the 5x9 sewer.

Env Problem: Nature and Extent of Contamination: Based upon data from the November 2006 Remedial Investigation (RI) Report, the primary contaminant at the site is polychlorinated biphenyl (PCB) contaminated oil in the vicinity of the B-26 coolant pit and the surrounding area where the 5X9 oval sewer passes under the site. The draft June 2009 Supplemental RI concluded that adjoining areas beyond the defined site are also contaminated with PCB contaminated oil. The contamination at the site resulted from spills of hydraulic oils and heat transfer fluids containing PCBs which were used at the plant during plant operations. Petroleum Oil Characterization: A number of groundwater wells contained separate phase oil and varied by geologic unit. Fill Unit: Oil was noted in approximately 26 of the 107 borings installed for environmental investigations initiated in 1994. Oil was present in 13 out of 30 fill wells, with thickness ranging from 0.01 to 5.66 feet. Most of the wells containing oil are located east of the 5x9 sewer and south of the B-26 Coolant Pit. The greatest volume of oil found was in wells CP 14, M-1, M-3. The estimated volume of recoverable oil in the fill unit is 50,000 to 110,000 gallons. Clay Unit: Oil was present in 23 out of 40 wells sampled, with thickness from 0.01 to 12.83 feet. MW-400 showed the greatest amount of product. The estimated volume of recoverable oil in clay unit is 1000 gallons. Bedrock Unit: Oil was present in 9 out of 18 wells, with thickness ranging from 0.01 to 4.07 feet. PCB Characterization: The PCB Aroclor 1248 was detected most frequently at the site, followed by Aroclor 1242. Aroclors 1254 and 1260 were detected in a limited

SUBSTATION 7 - 2ND FLOOR OF THE POWERHOUSE (Continued) **S104497613**

number of samples and PCB concentrations also vary by geologic unit. PCBs in Soil: The characterization summary of PCBs in subsurface soils at the site is as follows: PCBs are present in subsurface soils, consisting of fill, at up to 64 parts per million (ppm) and in native clay at up to 50 ppm, exceeding the NYSDEC soil cleanup objective; PCBs found in subsurface soils occur in the same areas where oil is observed in the subsurface soils; and No PCBs were found in till. PCBs in Groundwater: The fill and clay wells showing the greatest volumes of oil do not necessarily show highest levels of PCBs. PCB results, by respective geologic unit wells, are as follows: Fill Unit Wells: PCBs were detected in oil samples from 10 of 11 wells sampled. PCB concentrations varied from 2.17 ppm in MW 401 to 3,850 ppm in CP 28. Clay Unit Wells: PCBs were detected in all 19 clay wells sampled. The concentrations ranged from 4.4 ppm in MW 2A to 440,000 ppm in MW 406. Well CP 17A showed 3,620 ppm PCBs. Another source area may be around GP 12 where PCBs were detected at 840 ppm. Bedrock Unit Wells: Six bedrock wells sampled showed presence of PCBs varying from 2.8 ppm in CP 27B to 4,350 ppm in CP 23B to 12,000 ppm in CP 16B. Based on the PCB concentrations in groundwater and soil and groundwater gradient, it does not appear that PCBs are migrating from the site. However, PCB contaminated oil was determined to be seeping into the 5x9 oval sewer that traverses the site and former automotive parts manufacturing complex. Samples, including wipe samples, seeping oil and wall scrapings indicated the following: Water samples from downgradient manholes showed PCBs up to 0.785 parts per billion (ppb). Samples from laterals to the oval sewer revealed PCB levels up to 2.31 ppb and a water sample from a sewer clean-out revealed PCBs up to 68 ppb; Oil was found in laterals connected to the oval sewer with PCB levels up to 4.7 ppm. Concentrations of PCBs in standing oil in the oval sewer ranged from 440 ppm to 1,500 ppm; and Samples of oil stains on the oval sewer wall indicated PCBs levels ranging from 95 ppm to 565 ppm. The B-26 Coolant Pit Interim Remedial Measure (IRM) was implemented in 1991 to begin recovery of the PCB contaminated oil from soil and groundwater around the B-26 coolant pit. Operation of the oil recovery system for the B-26 coolant pit is ongoing. An IRM to collect groundwater/oil in areas where measurable levels of oil were detected and intercept groundwater/oil from potentially seeping into the 5x9 sewer was implemented in 2019. The collected oil is separated from the influent and the groundwater is treated through the B-26 coolant pit groundwater treatment system prior to discharge to the BSA sewer. Further site assessment and evaluation of long term remedial action measures to address site contamination is underway (2022).

SUBSTATION 7 - 2ND FLOOR OF THE POWERHOUSE (Continued) **S104497613**

POSSIBLY THE SEWER, MR. GLIECO
WILL NOTIFY BSA.

Remarks: Prior to Sept, 2004 data translation this spill Lead_DEC Field was MF
2/7/02:SAC TELECON TONY GLIECO - AA&M, LANDSTAR TRUCK WAS FOUND WITH THE CROSSOVER LINE LEAKING WHILE MAKING A DELIVERY, THEY ARE UNSURE WHAT CAUSED THE PUNCTURE IN THE CROSSOVER LINE, THERE WAS A SHEEN IN THE ROADWAY BUT DUE TO HEAVY TRAFFIC ALONG DELAVAN IT IS NOT CLEAR IF LEAK WAS CAUSED OUT THERE, MR. GLIECO SAID HE WOULD HAVE THOUGHT MORE PRODUCT WOULD HAVE BEEN FOUND OUT IN THE STREET IF THE LEAK HAD STARTED OUT THERE, ALSO NOTHING WAS FOUND ON-SITE WHICH MIGHT HAVE CAUSED THE PUNCTURE SO CAUSE OF THE PUNCTURE IS UNKNOWN, THEY SHUT THE VALVE ON THE CROSSOVER LINE TO STOP THE ONE SADDLE TANK FROM DRAINING, THEY PLACED A POLYPROPYLENE PAN WITH A ROLLOUT BAG UNDER THE PUNCTURED LINE TO COLLECT THE LEAKING PRODUCT, THEY USED A SCRUBBER TO COLLECT AND CLEAN THE PAVEMENT, THEY WILL EXCAVATE THE AREA NEAR THE RAILROAD TRACKS AS FAR AS THEY CAN WITHOUT UNDERMINING THE TRACKS. 02/07/02: MF S/I/TONY GLIECO, ET AL, AAM. HMHTTC HIRED BY RP TO CLEAN SITE. MOST OF SPILLAGE ON CONCRETE, NO DRAINS INVOLVED. SOME SPILLAGE GOT TO RR TRACKS, THIS WILL ALSO BE REMOVED. DEBRIS TO BE STAGED IN DRUMS. LIQUID IN AAM'S SWEEPER WILL BE PUMPED OUT, SWEEPER TANK CLEANED & PUMPED AGAIN, LIQUID WILL BE DISPOSED OF. SPEEDY DRY IN PLACE & WILL BE SWEPT UP. 02/08/02: MF S/I/TONY GLIECO, AREA CLEANED, TONY HAPPY. I NOTICED 6 STAGED DRUMS. 02/08/02: MF T/C CHARLEY BARRETT, SPILL RESPONSE MANAGEMENT, 770-736-6008, PO BOX 1666, SNELLVILLE, GEORGIA, 30078. EXPLAINED THAT REPORT & DISPOSAL RECEIPTS NECESSARY. HE WILL SEND THEM TO ME. HE WAS HIRED BY LANDSTAR TO OVER SEE CLEAN UP. HE HIRED HMHTTC. 02/13/02: MF 1ST DISPOSAL & REPORT LETTER, DUE 3/15/02. 02/15/02: MF RECEIVED REPORT & DISPOSAL RECEIPT. NO FURTHER ACTION NECESSARY. SPILL CLOSED.

10/15/97:RECEIVED AMERICAN AXLE & MFG.'S REPORT ON THE BAY AA-1 PROJECT INCLUDING SITE DIAGRAM AND DISPOSAL RECEIPTS,LETTER REQUESTED THAT THIS SPILL BE KEPT SEPARATE FROM 9400483,THEREFORE NEW SPILL NO. IS 9708298,ALL DOCUMENTATION REGARDING THIS FILE WILL BE UNDER 9708289. 3/12/98:SAC TELECON BARBARA SULLIVAN-BLASLAND,BOUCK,& LEE,WORK IS CONTINUING THIS SPRING AT PLANT,SO PHASE III REPORT WILL NOT BE COMING IN NEAR FUTURE. MS.SULLIVAN'S PHONE NUMBER IS 561-750-3733 & PETER SPENSE IN THE ROCHESTER OFFICE IS (716)292-6715. 12/7/99:SAC CALLED BARBARA SULLIVAN BUT SHE WAS NOT THERE, LEFT MESSAGE FOR A CALL BACK. 12/8/99:SAC TELECON BARBARA SULLIVAN, MS. SULLIVAN SAID THE REPORT HAS BEEN COMPLETED AND WAS SENT TO GM A COUPLE OF MONTHS AGO AND THEY ARE WAITING FOR GM'S APPROVAL TO RELEASE THE REPORT, THEY WILL BE MEETING W/MARK NAPOLITAN AROUND THE END OF THE MONTH AND WILL DISCUSS THIS WITH HIM THEN. 12/18/00:SAC CALLED MARK NAPOLITAN AND BARBARA SULLIVAN AND LEFT MESSAGE FOR A CALLBACK. 12/21/00:RECEIVED CALLBACK FROM MARK NAPOLITAN, MR. NAPOLITAN LEFT MESSAGE FOR A CALLBACK, SAC CALLED MR. NAPOLITAN BACK AND LEFT ANOTHER MESSAGE FOR A CALLBACK. 1/10/01:SAC CALLED MARK NAPOLITAN, LEFT MESSAGE FOR A CALLBACK. 1/10/01:SAC CALLED BARBARA SULLIVAN, MS. SULLIVAN IS STILL WORKING ON THE REPORT, SHE BELIEVES IT WILL BE DONE THIS WEEK AND SHE WILL SEND IT OFF TO MR. NAPOLITAN FOR HIS REVIEW, SAC SAID THE LAST TIME HE SPOKE TO MS. SULLIVAN HE WAS TOLD THAT REPORT HAD BEEN FINALIZED, MS. SULLIVAN SAID THAT THERE WAS A PROBLEM WITH THE ON-SITE SEWER SYSTEM FOR OIL AND GREASE AND THAT THEY HAD TO INVESTIGATE THE PROBLEM AND THEY NEEDED TO INCLUDE THIS INTO THE REPORT. 1/30/01:SENT NO RESPONSE LETTER TO MARK NAPOLITAN, REQUIRE COPY OF REPORT BY 3/30/01. 3/27/01:SAC RECEIVED PHONE MESSAGE FROM KATHY GALANTI - CONESTOGA ROVERS, THEY ARE WORKING W/BBL AND WILL BE SUBMITTING THE REPORT THIS MONDAY 4/3/01. 9/15/03:SAC TELECON CAROL BARRON - CONESTOGA ROVERS (297-6150), THEY SCRAPED ANOTHER SAMPLE FROM THE SEWER THIS PAST FRIDAY, THEY RETESTED THE WATER FROM MW-406, THEY WILL BE DOING ADDITIONAL INVESTIGATION AROUND MW-406 ALONG WITH THE PROPOSED WORK IN THE REPORT NEXT MONTH AND HOPE TO BE COMPLETED BY THANKSGIVING, THEY ARE ATTEMPTING TO SET UP MEETING W/BSA SOON BUT THEY SPOKE TO JIM OVERHOLT W/BSA AND HE REQUESTED IT BE DELAYED UNTIL NEW DIRECTOR IS UP TO SPEED ON PROJECT. 8/3/04:SAC TELECON KATHY GALANTI - CONESTOGA ROVERS. THEY HAVE FOUND A POOL OF OIL IN COMBINED SEWER LATERAL THAT WAS ANALYZED AND FOUND TO HAVE 1300 ppm OF PCBs. THE LATERAL IS NOT CONNECTED TO A KNOWN SOURCE. THEY WILL BE INSPECTING SEWER NEXT WEEK AND WILL BE RESAMPLING TO CONFIRM RESULTS. SINCE THERE IS NO APPARENT SOURCE FOR THE OIL, IT APPEARS THAT THE OIL HAS INFILTRATED THE SEWER. ONCE INVESTIGATION OF SOURCE HAS BEEN COMPLETED, THEY WILL PLUG THIS LINE. BSA HAS BEEN NOTIFIED OF THIS FINDING. 8/11/04:RECEIVED e-MAIL FROM DKK INSTRUCTING TO TRANSFER SITE TO LONG TERM REMEDIAL GROUP FOR FURTHER FOLLOWUP. SPILL CLOSED OUT, FILE GIVEN TO JASPAL WALIA.

Site Description: Location: The Saginaw-Buffalo site is an approximately 7.248-acre site, located in an urban area, at 320 Scajaquada Street in the City of Buffalo, Erie County. The site consists of the former Parking Lot #4 of the inactive manufacturing facility. Site Features: The site consists of a paved parking area. It is surrounded by industrial and residential properties. An electrical substation borders the site to the east. Current Zoning and Land Use: This site is zoned for industrial use. Past Use of the Site: Scajaquada Creek originally flowed through the southern portion of the site. The creek was rerouted through an underground concrete conduit, below what is now Scajaquada Street, in the mid 1920s. The former creek bed and adjacent low-lying areas were subsequently used for the disposal of ash by the City of Buffalo. A concrete plant operated on portions of the site from 1947 to 1966. General Motors (GM) purchased several parcels in the mid 1960s and constructed Parking Lot #4. The site was sold to American Axle Manufacturing in 1994, along with the main facility west of the railroad right-of-way. In November 1994, American Axle Manufacturing began construction of a parts coating facility on the northern third of Parking Lot #4. Operations at the facility ceased in December 2007. The property was sold to East Delavan Property, LLC in October 2008. During a spill cleanup of industrial oil in 1989 excavated soil was found to contain polychlorinated biphenyls (PCBs). Site Geology and Hydrogeology: The bedding material underneath the asphalt pavement is approximately one foot deep. Below the bedding material is a layer of ash/slag type black or brown fill intermixed with other materials which varies in thickness from 2 to 7 feet across the site. Below this fill is a thin layer of black organic silt up to one foot in thickness. The thickness of the silty clay layer below the black organic silt ranges from 10 to 12 feet. This is underlain by Onondaga limestone bedrock which is approximately 17 to 19 feet below ground surface (fbgs). The groundwater is found at a depth of 3 to 4 fbgs and is believed to be due to perched water conditions. The general direction of groundwater flow in the overburden appears to be to the south towards the Scajaquada Creek Drain. Based upon the regional hydrogeology, it is assumed that groundwater in the bedrock flows towards the

SAGINAW - BUFFALO (Continued) **S120706246**

	west-northwest.
Env Problem:	Remediation of the site is complete. Prior to remediation, the primary contaminants of concern were polychlorinated biphenyls (PCBs) and lead in soil, groundwater and sewer sediments. Remedial actions have successfully achieved soil cleanup objectives for industrial use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem:	There is little potential for exposure to contaminated soils because access to the site is restricted and the contaminated soils are covered by a paved parking lot. The existing deed restriction prevents use of the site property for purposes other than industrial uses, thereby preventing the use of groundwater for drinking. The area is served by public water so exposures via drinking water are not expected. The remedy which included the removal of contaminated soils, maintenance of existing pavement, and deed restrictions will reduce the potential for exposure to site-related contaminants.

Site Description:	Location: The Diarsenol Co., Kingsley Park site is an approximately 2.216-acre site located in a residential neighborhood on Kingsley Street in the City of Buffalo, Erie County. Site Features: The site is a flat, grass covered lot with no buildings. Fencing surrounds much of the site. Current Zoning and Land Use: The site is currently a park owned by the City of Buffalo. Past Use of the Site: The Diarsenol Company occupied the property on Kingsley Street adjacent to the site starting in about 1900. Diarsenol manufactured medications containing arsenic at their facility from the early 1900s until the 1940s. They reportedly used this site for disposal of waste materials from their plant. The site was occupied by various owners from the 1940s until 1967, when it was acquired by the City of Buffalo. The site has been used as a public park and playground since 1972. Site Geology and Hydrology: The Site is currently covered with topsoil overlying clean fill and native clay. Minimal shallow-goundwater contamination is still present in an area proximal to the groundwater collection system.
Env Problem:	Remediation at the Site is complete. Prior to remediation, the primary contaminant of concern was arsenic in soil and groundwater. Remedial actions have successfully achieved soil cleanup objectives for restricted-residential use. Residual contamination in soil and groundwater is being managed under a Site Management Plan.
Health Problem:	Remedial activities to address soil contamination conducted at the site and at some nearby off-site properties have effectively reduced the potential for exposure to site-related contaminants. People are not drinking the contaminated groundwater because the area is served by a public water supply that is not affected by this contamination.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 12/26/2023
Date Data Arrived at EDR: 01/02/2024

Next Scheduled EDR Contact: 04/08/2024
Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 12/26/2023

Lists of Federal sites subject to CERCLA removals and CERCLA orders

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 12/20/2023

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 09/19/2023

Data Release Frequency: Quarterly

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

RES DECL: Restrictive Declarations Listing

A restrictive declaration is a covenant running with the land which binds the present and future owners of the property. As a condition of certain special permits, the City Planning Commission may require an applicant to sign and record a restrictive declaration that places specified conditions on the future use and development of the property. Certain restrictive declarations are indicated by a D on zoning maps.

Lists of state and tribal voluntary cleanup sites

VCP: Voluntary Cleanup Agreements

New York established its Voluntary Cleanup Program (VCP) to address the environmental, legal and financial barriers that often hinder the redevelopment and reuse of contaminated properties. The Voluntary Cleanup Program was developed to enhance private sector cleanup of brownfields by enabling parties to remediate sites using private rather than public funds and to reduce the development pressures on "greenfield" sites.

ERP: Environmental Restoration Program Listing

In an effort to spur the cleanup and redevelopment of brownfields, New Yorkers approved a $200 million Environmental Restoration or Brownfields Fund as part of the $1.75 billion Clean Water/Clean Air Bond Act of 1996 (1996 Bond Act). Enhancements to the program were enacted on October 7, 2003. Under the Environmental Restoration Program, the State provides grants to municipalities to reimburse up to 90 percent of on-site eligible costs and 100% of off-site eligible costs for site investigation and remediation activities. Once remediated, the property may then be reused for commercial, industrial, residential or public use.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS RCRA MANIFEST: PFAS Transfers Identified In the RCRA Database Listing

To work around the lack of PFAS waste codes in the RCRA database, EPA developed the PFAS Transfers dataset by mining e-Manifest records containing at least one of these common PFAS keywords: PFAS, PFOA, PFOS, PERFL, AFFF, GENX, GEN-X (plus the VT waste codes). These keywords were searched for in the following text fields: Manifest handling instructions (MANIFEST_HANDLING_INSTR), Non-hazardous waste description (NON_HAZ_WASTE_DESCRIPTION), DOT printed information (DOT_PRINTED_INFORMATION), Waste line handling instructions (WASTE_LINE_HANDLING_INSTR), Waste residue comments (WASTE_RESIDUE_COMMENTS).

PFAS ATSDR: PFAS Contamination Site Location Listing

PFAS contamination site locations from the Department of Health & Human Services, Center for Disease Control & Prevention. ATSDR is involved at a number of PFAS-related sites, either directly or through assisting state and federal partners. As of now, most sites are related to drinking water contamination connected with PFAS production facilities or fire training areas where aqueous film-forming firefighting foam (AFFF) was regularly used.

PFAS WQP: Ambient Environmental Sampling for PFAS

The Water Quality Portal (WQP) is a part of a modernized repository storing ambient sampling data for all environmental media and tissue samples. A wide range of federal, state, tribal and local governments, academic and non-governmental organizations and individuals submit project details and sampling results to this public repository. The information is commonly used for research and assessments of environmental quality.

PFAS NPDES: Clean Water Act Discharge Monitoring Information

Any discharger of pollutants to waters of the United States from a point source must have a National Pollutant Discharge Elimination System (NPDES) permit. The process for obtaining limits involves the regulated entity (permittee) disclosing releases in a NPDES permit application and the permitting authority (typically the state but sometimes EPA) deciding whether to require monitoring or monitoring with limits. Caveats and Limitations: Less than half of states have required PFAS monitoring for at least one of their permittees and fewer states have established PFAS effluent limits for permittees. New rulemakings have been initiated that may increase the number of facilities monitoring for PFAS in the future.

PFAS ECHO: Facilities in Industries that May Be Handling PFAS Listing

Regulators and the public have expressed interest in knowing which regulated entities may be using PFAS. EPA has developed a dataset from various sources that show which industries may be handling PFAS. Approximately 120,000 facilities subject to federal environmental programs have operated or currently operate in industry sectors with processes that may involve handling and/or release of PFAS.

PFAS ECHO FIRE TRAINING: Facilities in Industries that May Be Handling PFAS Listing

A list of fire training sites was added to the Industry Sectors dataset using a keyword search on the permitted facilitys name to identify sites where fire-fighting foam may have been used in training exercises. Additionally, you may view an example spreadsheet of the subset of fire training facility data, as well as the keywords used in selecting or deselecting a facility for the subset. as well as the keywords used in selecting or deselecting a facility for the subset. These keywords were tested to maximize accuracy in selecting facilities that may use fire-fighting foam in training exercises, however, due to the lack of a required reporting field in the data systems for designating fire training sites, this methodology may not identify all fire training sites or may potentially misidentify them.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration?s document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

PFAS 3: PFAS Environmental Site Remediation List

Per- and Polyfluoroalkyl Substances (PFAS) are a group of chemicals used to make fluoropolymer coatings and products that resist heat, oil, stains, grease, and water. Fluoropolymer coatings are blends of resins and lubricants used in products such as water-repellent clothing, furniture, adhesives, paint and varnish, food packaging, heat-resistant non-stick cooking surfaces and insulation of electrical wires. Chemicals in this group include perfluorooctanoic acid (PFOA) and perfluorooctane sulfonic acid (PFOS).

HSWDS: Hazardous Substance Waste Disposal Site Inventory

The list includes any known or suspected hazardous substance waste disposal sites. Also included are sites delisted from the Registry of Inactive Hazardous Waste Disposal Sites and non-Registry sites that U.S. EPA Preliminary Assessment (PA) reports or Site Investigation (SI) reports were prepared. Hazardous Substance Waste Disposal Sites are eligible to be Superfund sites now that the New York State Superfund has been refinanced and changed. This means that the study inventory has served its purpose and will no longer be maintained as a separate entity. The last version of the study inventory is frozen in time. The sites on the study will not automatically be made Superfund sites, rather each site will be further evaluated for listing on the Registry. So overtime they will be added to the registry or not.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 08/07/2023

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Elevation:	640 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	14122104 BUFFALO NE, NY
Version Date:	2019

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

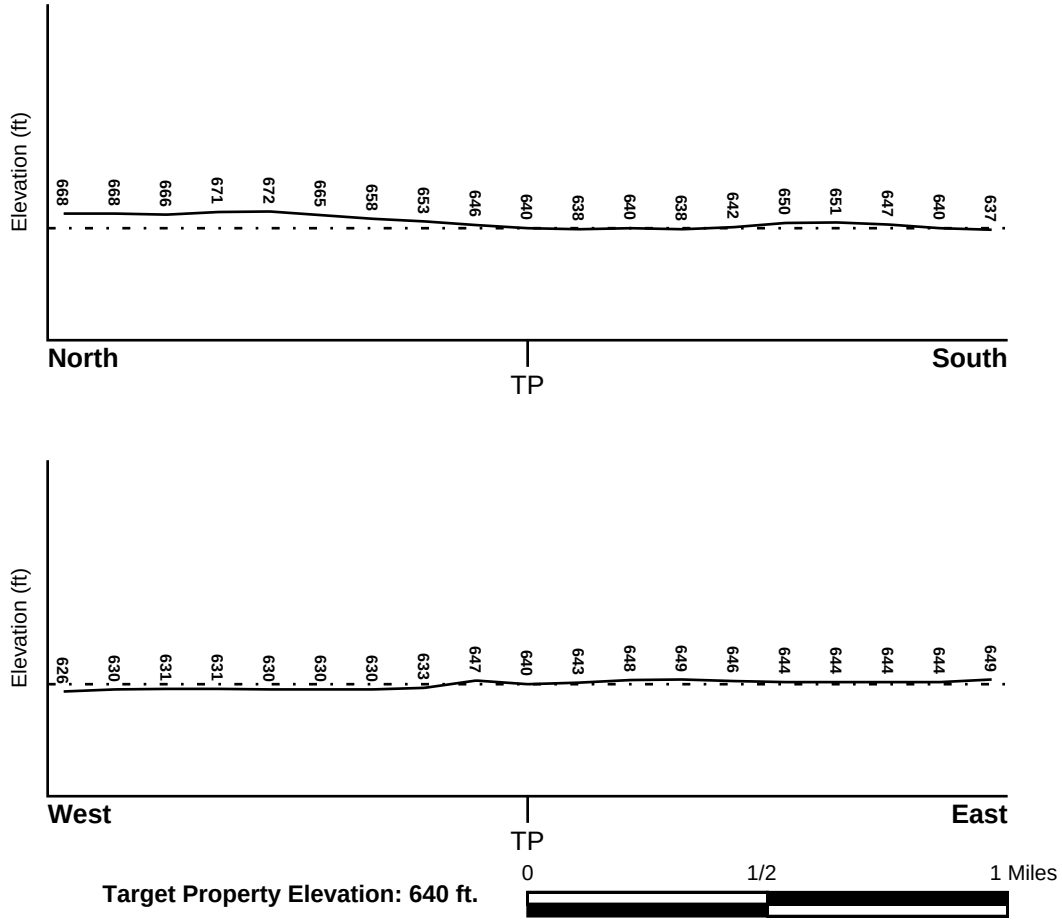
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
3602300005B	FEMA Q3 Flood data

Additional Panels in search area:	FEMA Source Type
3602300015B	FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
BUFFALO NE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Urban land

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

Soil Map ID: 2

Soil Component Name: Urban

Soil Surface Texture:
Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 77 inches

Depth to Watertable Min: > 66 inches

No Layer Information available.

Soil Map ID: 3

Soil Component Name: Udorthents

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 137 inches

No Layer Information available.

Soil Map ID: 4

Soil Component Name: Urban

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 54 inches

No Layer Information available.

Soil Map ID: 5

Soil Component Name: Urban

Soil Surface Texture:
Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class:
Hydric Status: Unknown

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 38 inches

Depth to Watertable Min: > 0 inches

No Layer Information available.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005, 2010 and 2015 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Freshwater Wetlands
Source: Department of Environmental Conservation
Telephone: 518-402-8961

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

FOIL Requests & Responses

Holley Chamberlin

From: New York DEC FOIL Center <newyorkdec@govqa.us>
Sent: Wednesday, January 31, 2024 12:39 PM
To: Holley Chamberlin
Subject: FOIL Request :: W126313-013124

Dear Holley:

Thank you for your Freedom of Information Law (FOIL) request. Your request has been received and is being processed. Your request was received in this office on 1/31/2024 and given the reference number FOIL #W126313-013124 for tracking purposes. You may expect the Department's response to your request no later than **2/29/2024**.

Record Requested: **Please forward me environmental records the property addressed as 631 Northland Avenue in the City of Buffalo, Tax ID#140200101.21-5-1.21, owned by 631 Northland LLC. Please include the following records: • spills releases (please include spill reports and associated records/mapping/reports) • petroleum bulk storage (PBS) including underground storage tanks (USTs) • health or environmental violations • wetlands • consent order • permits • hazardous waste activity**

You can monitor the progress of your request at the link below and you'll receive an email when your request has been completed. Again, thank you for using the FOIL Center.

Click here to login to the FOIL Center.

New York State Department of Environmental Conservation, Record Access Office

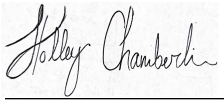
Track the issue status and respond at:
https://newyorkdec.govqa.us/WEBAPP//_rs/RequestEdit.aspx?rid=126313

ERIE COUNTY CLERK's OFFICE
Freedom of Information Law
Application For Access to Public Records

Instructions: Complete this form and return, by mail, email, or deliver in-person, to the FOIL Officer at the **Erie County Clerk's Office, 92 Franklin Street Buffalo, NY 14202 or ECCOFOIL@erie.gov**

****To request information maintained by an independent office within Erie County Government (i.e., Board of Elections, County Executive, Comptroller, District Attorney, Legislature, and Sheriff) you must contact that office directly on how to submit a FOIL request. ****



The Erie County Clerk's Office will respond within 5 days of receipt of your request to acknowledge receipt and / or make the record available for review. Many records are already available for review in the Clerk's Office at the public computers or, if the record sought is a court record, by going online to https://iapps.courts.state.ny.us/nyscef/HomePage. If the record is not available within five days of receipt of such request, you will be advised of the approximate date when such record may be made available or when such request may be granted or denied.

In accordance with the Public Officers Law and the statutory authority granted under the New York Civil Practice Law and Rules, the Clerk's Office may charge $0.65 per page with a minimum fee of $1.30 as well as other charges associated with the cost of reproducing a record. Payment MUST be made at time of pick-up. If mailing is requested, please provide a self-addressed postage paid envelope.

I hereby apply to [ ] inspect or obtain [ ] a hard copy [X] an electronic copy of the following records under the provisions of the Freedom of Information Law (please include as much detail about the records as you can, including relevant dates, names, descriptions, ect): _____

Please forward me environmental records the property addressed as 631 Northland Avenue in the City of Buffalo, Tax ID#140200101.21-5-1.21, owned by 631 Northland LLC. Please include the following records: Liens/deed restrictions, chemical and/or petroleum spills/releases, underground storage tanks, health or environmental violations, wetlands, consent order, permits, hazardous waste activity, and waste disposal facilities within one half mile.

*If your request is for a list of names and addresses produced by this office, by signing this form, you are certifying that you will not use such list for solicitation or fund-raising purposes Print Name and Organization and will not sell, give or otherwise make available such list to any other person for the purpose of allowing that person to use such lists of names and addresses for solicitation or fundraising purposes.

APPENDIX 7

Qualifications of Professionals

Whitney McAlpin
Environmental Scientist

RAVI ENGINEERING & LAND SURVEYING, P.C.

EDUCATION

B.S., Environmental Sciences, SUNY Fredonia

CERTIFICATIONS

OSHA 40 hour HAZWOPER
OSHA 10 Hour Construction Safety Course
NYSDOH Certified Asbestos Inspector

Ms. McAlpin has over eleven years of experience performing Phase I and II Environmental Site Assessments (ESAs). She has conducted ESAs on numerous property types including private, commercial, industrial and manufacturing facilities, warehouses, gasoline filling stations, automobile service and repair facilities, office buildings, apartment complexes, restaurants, and vacant or undeveloped properties.

PROJECTS

Old Upper Mountain Road, Lockport, NY - RE&LS provided environmental inspections and on-site construction administrative tasks for the Old Upper Mountain Road Site in Lockport, NYSDEC Site No. 932112. RE&LS provided a full-time Air Monitoring Technician (AMT) that was onsite daily for the duration of the project to provide air and fugitive dust monitoring. The AMT also provided daily weather, and creek stage monitoring, and assisted the Sampling Technician with the collection of samples for fill characterization, water treatment system efficacy, and usability of imported soils. Quality Assurance services and assistance with the Green Remediation Plan were included.

690 Portland Avenue NYSDEC Brownfield Cleanup, Rochester, NY - This project site is the former JML Optical property at 690 Portland Avenue in the city of Rochester, NY. RE&LS was asked to investigate the cleanup of the trichloroethylene (TCE)-contaminated project for the city. Decades of the operation of JML Optical resulted in a TCE plume in groundwater migrating away from the former JML building, impacting the residential properties to the west. The investigation included the installation of overburden and bedrock monitoring wells, and sampling soil, and groundwater. Soil vapors were also sampled in conformance with the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York. Based on these results, NYSDEC requested that we install a deeper bedrock well. RE&LS installed and sampled the deeper well by "packer testing" to segregate the zones of contaminated bedrock groundwater. RE&LS completed the Remedial Investigation (RI) in compliance with the BCP. Several Interim Remedial Measures dealing with the dense non-aqueous phase liquid (DNAPL) cleanup of TCE were performed. This included the installation of sub-slab depressurization systems (SSDS) in three residential properties along Portland Avenue to address TCE vapor encroachment, as well as source removal of approximately two drums of hazardous TCE-contaminated sump sediments from inside of the former JML building.

Finger Lakes Area Counseling & Recovery Agency, Clifton Springs, Ontario County, NY - The Finger Lakes Area Counseling and Recovery Agency (FLACRA) is a multi-county residential and outpatient substance abuse treatment agency serving individuals and families in the Finger Lakes. A NEPA screening was conducted to construct a new building on currently undeveloped land located. The new building is an 11,500 square foot (sq. ft.) and houses administrative offices, multiple programs, staff and an Opioid Crisis Center. RE&LS provided a Phase I Environmental Site Assessment for the environmental screening necessary to complete the Environmental Report documenting preliminary compliance with National Environmental Policy Act (NEPA). The Environmental Report was required to secure funding through the United States Department of Agricultural (USDA) for the proposed construction of the Administration Building

City of Rochester, Phase II Environmental Site Assessment, 101-113 Franklin Street, 106 Pleasant Street, Rochester, New York
The Site consisted of two City-owned parcels of undeveloped land ("parking lot") and ("vacant commercial land"). The City regarded the Site as a future mixed-use development site that could include apartments or townhouses. The site has a 140 year history of residential and commercial use and a Sanborn Map that depicted three gasoline tanks on the northern part of the Site. In addition, the site has documented history of a printing shop, automobile repair facility, welding shop, dry cleaning facility, photographic facility, and metal foundry buildings over the properties long history. RE&LS environmental services included: soil test borings and installation of groundwater monitoring wells; toxicity characteristic leaching procedure (TCLP) sampling of soil or fill materials; water level measurements and survey of monitoring well evaluations; GPS recording of Phase II ESA; Preliminary Geotechnical investigation point locations; characterization and disposal of investigation-derived waste; and a Preliminary Geotechnical. (2019)

Rochester Central School District School, No. 6 Dag Hammarskjold Elementary School Phase I & Limited Phase II ESA, City of Rochester - RE&LS performed a Phase I and Limited Phase II ESA to investigate petroleum odors encountered during a geotechnical survey of the Site. Whitney assisted with the Phase I and provided field work, drilling oversight, soil screening, and collected soil and groundwater samples to investigate Site conditions. Whitney assisted with the oversight during an EM Survey to investigate suspect and potential underground storage tanks, and and prepared the Remedial Action Plan to delineate and remediate the spill. (2018)

First Buffalo River Marina Capital Improvements, Buffalo, NY - The Erie Canal Harbor Development Corporation retained RE&LS as part of a design team to provide master planning, environmental review, site management plan, design, permitting, bidding, and construction administration and inspection services related to the capital improvement of the First Buffalo River Marina. RE&LS reviewed a previous Phase I ESA. RE&LS recommend collecting surficial soil samples across the Site. We also recommended a radiological survey across the Site to investigate for radioactive slag. Whitney performed a Historical records review**.** (2018)

111 West Shore Boulevard, Newark, NY (drycleaner) – Phase II Whitney conducted a Phase I and Limited Phase II Environmental Site Assessment (ESA) in the Town of Newark, New York, in conformance with the NYSDOH soil vapor intrusion protocols. The project also included indoor air sampling. The Site was used as a dry cleaning facility from 1989 until 2016. (2018)

136 Barberry Terrace, Rochester, New York – Phase II Whitney prepared a Phase II ESA to address potential vapor intrusion conditions. Based on the construction date of the subject building and the presence of LBP (lead-based paints), surficial soil was potentially contaminated with lead. She collected one composite soil sample from beneath the dripline of the subject building. Numerous VOCs indicative of contamination from a petroleum spill, an auto body repair shop and/or manufacturing operations were detected in the sub-slab and indoor air samples. (2018)

129 Fernwood Avenue, Rochester, NY – Phase II Whitney prepared a Phase I ESA report and concluded that vapor encroachment was a potential concern. She supervised a Phase II ESA including surficial soil sampling for lead, groundwater sampling using a geoprobe and installation of a temporary groundwater monitoring well.

Speedy's Cleaners, 3130 Monroe Ave, Rochester, NY– Whitney performed field sampling for soil vapor intrusion via the placement of Summa air canisters at this brownfield site. The field sampling was required to perform a series of sub-slab differential pressure measurements to determine soil vapor intrusion mitigation system coverage and efficiency. She also provided oversight for the installation of improvements to a sub slab depressurization system.

Environmental Oversight of Reef Vessel Preparations New York State Canal Corporation, Environmental Oversight Reliable Vessel, Phoenix NY RE&LS conducted Environmental Oversight activities for vessel preparation of the Reliable located in Phoenix, New York. RE&LS provided guidance to the contractor with the goal of meeting the remediation requirements as provided by the NYS Department of Environmental Conservation and the USEPA document titled "National Guidance: Best Management Practices for Preparing Vessels Intended to Create Artificial Reefs." RE&LS ensured all materials were properly removed and disposed of in accordance with all best management practices, applicable federal and state rules and regulations. RE&LS also provided environmental monitoring services on this project. (2019)

Inactive Hazardous Waste Disposal Site—Rochester NY - As part of a refinance, RE&LS was retained to conduct a Phase I ESA at a City of Rochester property. The facility was formerly listed as an inactive hazardous waste disposal site, based on its 90 year history as an aluminum and sheet metal manufacturing facility. Multiple investigations completed at the property identified chlorinated solvent impacts on site soils and groundwater. Ms. McAlpin was responsible for conducting the Phase I ESA in accordance with ASTM standards and assisted in the client's assessment of current environmental risk.

Buffalo Outer Harbor State Park, Buffalo, NY RE&LS was responsible for the Asbestos and Hazardous Materials survey and sampling, inspection, and testing for PCB caulks. This included a room-by-room investigation of all interior and exterior spaces within ten buildings. Sampling was performed in accordance with AHERA regulations, 40 CFR Part 763.86 and 763.87 and NYS Code Rule 56. As part of this project, Whitney performed surficial and subsurface soil sampling using a geoprobe for VOCs, metals and soil health analysis. She also measured soil compaction using a penetrometer. (2019-2020)

Transportation
RE&LS provided environmental screenings on these transportation projects. Services included determination of the NEPA and SEQR classifications, as well as the evaluation of potential impacts on: general ecology and endangered species, ground water, surface water, state and federal wetlands, floodplains, navigable waterways, historic resources, hazardous waste, asbestos, noise, air quality, energy, farmland, visual impacts and critical environmental areas. Whitney assisted in gathering information and preparation of reports for environmental screenings on the following

Inactive Hazardous Waste Disposal Site—Rochester NY - As part of a refinance, Ms. McAlpin was retained to conduct a Phase I ESA at a City of Rochester property. The facility was formerly listed as an inactive hazardous waste disposal site, based on its 90 year history as an aluminum and sheet metal manufacturing facility. Multiple investigations completed at the property identified chlorinated solvent impacts on site soils and groundwater. Ms. McAlpin was responsible for conducting the Phase I ESA in accordance with ASTM standards and assisted in the client's assessment of current environmental risk.

PROFESSIONAL EXPERIENCE

Lynn is an environmental professional with over ten years of experience performing Phase I Environmental Site Assessments, Phase II investigations, air project monitoring, Hazardous Materials Inspections, and remedial plans, soil gas surveys, underground storage tank closures, Brownfield Cleanup Program remedial investigations, and NYSDEC Electronic Data Deliverable (EDD) preparation. She is a dedicated environmental professional proficient in environmental chemistry analytical techniques, and Geographical Information Systems.

PROJECTS

690 Portland Avenue NYSDEC Brownfield Cleanup, Rochester, NY -This project site is the Former JML Optical property at 690 Portland Avenue in the City of Rochester, NY. RE&LS conducted the remedial investigation of this trichloroethylene (TCE)-contaminated property. Decades of the operation of Former JML Optical resulted in a TCE plume in groundwater migrating away from the site, impacting the residential properties to the west. The investigation included the installation of overburden and bedrock monitoring wells, and soil and groundwater sampling for contaminants of concern and PFAS analytes.. Soil vapors were sampled in conformance with the NYSDOH Guidance for Evaluating Soil Vapor Intrusion in the State of New York. Based on these results, NYSDEC requested that a deeper bedrock well was installed. RE&LS installed and sampled the deeper well by "packer testing" to segregate the zones of contaminated bedrock groundwater. RE&LS completed the Remedial Investigation (RI) in compliance with NYSDEC DER-10 regulations. Several Interim Remedial Measures were performed. This included the installation of sub-slab depressurization systems (SSDS) in three residential properties along Portland Avenue to address TCE vapor encroachment, as well as source removal of approximately two drums of hazardous TCE-contaminated sump sediments from inside of the former JML building.

University at Albany, Class Lab Renovation Phase VI, Albany, New York - The Class Lab Renovation Phase VI included the renovation of labs and classroom space within the Biology and Chemistry Buildings on the Uptown Campus of the University of Albany. RE&LS provided Inspection and Design Services for the Project as well as Project Monitoring and Air Sampling during construction. The Project included the removal of asbestos-containing, PCB-containing and lead-containing materials over the course of several phases lasting over a 1-year period. RE&LS's Project Monitor was instrumental in identifying disturbed vermiculite insulation during construction prior to further demolition activities assisted in preventing a much larger incidental disturbance. RE&LS collected over 1,000 air samples during the abatement and provided visual inspections for over twenty-five work areas.

Lyell Ave, Rochester, NY –RE&LS performed Phase I & II Environmental Site Assessments for Edward N. Annechino/Josephine Annechino Trust and Knauf Shaw LLP. The subject site was a nearly half-acre lot with a brick building at the southeast corner of the Lyell Avenue and Mt. Read Boulevard intersection in the City of Rochester, New York. The site was originally opened as a gas station in 1921 and operated as a gas station and auto center by a series of owners until the 2000s. RE&LS conducted an intial site inspection of the historic pump islands, on-site brick building, UST pads and vent pipes south of the building, indicative of an historic waste oil tank, and the fuel oil tank.

Rome Waterfront Village Infrastructure Improvements, Rome, NY - The Rome Waterfront Village project was intended to foster the revitalization of the area between South James Street and Erie Boulevard north of the Erie Canal as well as improve public access to the canal. The development included the construction of a bulkhead and dock system within the Erie Canal as well as public walkways, seating areas, utility infrastructure, and stormwater management practices. Lynn performed Phase I ESA's to investigate the potential impact of several properties in the Rome Waterfront Village Infrastructure Improvement project. The Phase I Environmental Site Assessment (ESA's) where on each of the two Sites within the Rome Waterfront Village project area. Lynn also provided a third party review on the historical documents of the sites.

City of Rochester, Bull's Head Brownfield Opportunity Area (BOA), Rochester, NY – This project included community participation, research, analysis, and planning activities necessary to conduct and prepare a BOA Nomination Study Report of the area referred to as the Bull's Head neighborhood which was defined as approximately 188 acres of land that centers on the intersections of Brown Street, West Main Street, Genesee Street, Chili Avenue and West Avenue in the City of Rochester. RE&LS provided a detailed description and analysis of existing conditions, opportunities, and reuse potential for properties located in the BOA with an emphasis on the identification and reuse potential of strategic sites. RE&LS also provided the initial environmental conditions screening of parcels within the project site to identify potential brownfield sites.

Oswego Canal Corridor BOA Step 3 Oswego, NY - This consists of a 1,345 acre area on the City's waterfront characterized by 49 identified brownfield, vacant, and underutilized sites. The primary community revitalization objectives include creating a vibrant sustainable mixed use redevelopment district that enhances the City's historic downtown and port, providing access to the City's waterfront areas, supporting targeted industry growth, and complementing adjacent residential neighborhoods. Lynn performed two (2) Phase I ESAs to investigate the potential impact of several properties in the Oswego Canal Corridor BOA project area.

African American Cultural Center, Buffalo, NY - RE&LS was retained by the Buffalo Urban Renewal Agency for environmental consultant services for Phase I & Phase II Environmental Site Investigations for ten (10) properties located on Glenwood Avenue, Masten Avenue, and East Utica Street in the City of Buffalo. RE&LS's responsibilities included a visual inspection for suspect asbestos containing materials, suspect lead-based paint, mercury containing lights, switches and PCB ballasts, and possible mold contamination due to water intrusion. Survey responsibilities included a boundary survey and test boring locations at all properties.

5 & 15 Flint Street Brownfield Remedial Investigation, Rochester, NY - RE&LS has completed the Remedial Investigation for the New York State Department of Environmental Conservation Brownfield Cleanup Program (BCP) for the 5 & 15 Flint Street sites in Rochester, New York; this site is contiguous at the north side of the City of Rochester Vacuum Oil BCP. Lynn provided field work, drilling oversight, well development, soil vapor pathway sampling and analysis, collected water quality parameters, and screened for volatile organic compounds using a photo-ionization detector (PID).The groundwater collection method used was a low flow purging and sampling method with a bladder pump. In addition, Lynn prepared both the EDD and the RIR.

1440 Empire Boulevard Brownfield Remediation, Rochester, NY - The Site was an approximately 4.5-acre parcel on Empire Boulevard, it was proposed for a 358-unit apartment complex. Lynn was the lead on-site consultant during remedial activities to ensure that all work within the limits of the BCP was performed in accordance with the Remedial Action Work Plan (RAWP). Lynn sampled imported soils to ensure that soils met the NYSDEC criteria for soils used in the soil cover system, performed CAMP air monitoring (Community Air Monitoring Program) to ensure that contaminated soils were not migrating off-site. Lynn prepared the Final Engineering Report (FER) and the Electronic Data Deliverable (EDD). RE&LS continues to provide CAMP monitoring whenever the cap is breeched, as well as soil sampling of imported soils under the SMP.

10 Chapin Street Brownfield Remedial Action, Rochester, NY - RE&LS was hired to conduct the remediation of this former manufacturing site. Lynn prepared the Draft Remedial Action Work Plan.

37 Bittner Street, Rochester, NY - 37 Bittner Street is the parking lot at the north side of the Kirstein Building. It is proposed for development as a 93,200 sq. ft. 6-story apartment building with an underground parking garage. The parking lot at 37 Bittner Street was historically used as a public gas station with documented petroleum contamination in the underlying soils and groundwater. RE&LS obtained NYSDEC approval to perform a Brownfield Cleanup Program (BCP) to further define the nature and extent of potential on-site impacts resulting from historical operations at the site. The results of this investigation were used to evaluate remedial actions required to render the site suitable for development. Lynn provided groundwater sampling and underground storage tank (UST) closure assistance.

Rochester Central School District School No. 6 Dag Hammarskjold Elementary School Phase I & Limited Phase II ESA, City of Rochester - RE&LS performed a Phase I and Limited Phase II ESA to investigate petroleum odors encountered during a geotechnical survey of the site. Lynn performed the Phase I and provided field work, drilling oversight, soil screening, and collected soil and groundwater samples to investigate Site conditions. Based on the results of the Phase II, a petroleum spill was reported to the NYSDEC. Subsequent to the results of the Limited Phase II ESA, Lynn provided oversight during an EM Survey to investigate suspect and potential underground storage tanks, and conducted a subsurface investigation to delineate and remediate the spill, and prepared the Remedial Action Plan.

New Police Station, Niagara Falls State Park, Niagara Falls, NY - RE&LS provided Environmental and Permitting services for this term contract for the Rehabilitation and Improvement of various facilities at the Niagara Falls State Park. As part of this contract, RE&LS provided a Phase I Environmental Site Assessment (ESA) at the proposed new Police Station site along the Gorge Rim south of the existing Discovery Center. Findings from the Phase I ESA led to a Phase II test pit investigation, sampling, and radiological survey. Lynn was responsible for the Phase II radiological survey, soil sampling and vapor screening.

Richland Estates Phase I ESA, Greece, NY - RE&LS conducted a Site inspection for this residential development of eight lots in the Town of Greece, New York. Lynn performed the investigation, and prepared the Phase I ESA report in accordance with ASTM 1527-13.

Benjamin Reddy has over 16 years of experience of professional consulting in all facets of environmental related projects. His specialty and area of expertise in asbestos, lead and PCB abatement, regulatory compliance, radon studies, environmental and hazardous waste assessments provides clients with comprehensive solutions. His experience has consisted of site investigations, collection of asbestos and hazardous waste materials for analytical (bulk and air) testing, development of contract plans, specifications, and construction cost estimates for remediation projects, and development of hazardous and asbestos management plans, contractor oversight and report generation.

PROJECTS

Town of Ontario Library Renovations, Ontario, NY - RE&LS was retained by Town of Ontario to conduct a Limited Pre-Renovation Asbestos Survey/Inspection at Ontario Public Library. Certified Asbestos Inspectors assessed interior spaces for suspect asbestos-containing building materials that may be impacted by the proposed renovation project to determine the presence, location, quantity, and condition of asbestos-containing materials (ACMs). The Survey/Inspection was conducted to support the proposed ADA Accessibility Upgrades and general refurbishment renovation project at Ontario Public Library. RE&LS conducted the Survey/Inspection and provided the Hazardous Materials Inspection Report.

Old Upper Mountain Rd., Lewiston, NY - RE&LS provided environmental inspections and on-site construction administrative tasks for the Old Upper Mountain Road Site in Lockport, NYSDEC Site No. 932112. RE&LS provided a full-time Air Monitoring Technician (AMT) that was onsite daily for the duration of the project to provide air and fugitive dust monitoring. The AMT also provided daily weather, and creek stage monitoring, and assisted the Sampling Technician with the collection of samples for fill characterization, water treatment system efficacy, and usability of imported soils. Quality Assurance services and assistance with the Green Remediation Plan were included.

Wyoming Bus Facility Project, Wyoming County, NY - RE&LS performed a Pre-Renovation Asbestos Inspection, Lead Paint Survey, and PCB Caulk Survey for buildings at the Wyoming County Bus Facility. Following the inspection RE&LS created construction documents, abatement design documents and specifications for the removal of hazardous material. This project is currently in the design phase. It is anticipated that RE&LS performed the project/air monitoring services when abatement occurs.

Niagara Falls State Park Orin Lehman Visitor Center and Administration Building, Niagara Falls, NY - RE&LS conducted a Pre-Demolition Hazardous Materials Inspection consisting of a Pre-Demolition Asbestos Survey/Inspection, Pre-Demolition Polychlorinated Biphenyl (PCB) Caulk Survey, and Pre-Demolition Lead Paint Survey was completed at Niagara Falls State Park Orin Lehman Visitor Center. RE&LS provide a report of the results of the inspection/survey. RE&LS prepared Asbestos Abatement Design documents, including, plans and specifications for the renovation project and provided Construction Administration Services throughout the execution of the renovation.

Buffalo Outer Harbor – Terminal A, Buffalo, NY - RE&LS provided a Visual Assessment and Limited Asbestos Survey/Inspection for suspect asbestos-containing materials (ACMs) and the overall condition of the building materials of select areas in the building in Terminal A at Buffalo Outer Harbor. Based on the condition and presence of asbestos-containing materials and lead-based paint in the specific areas in Terminal A, RE&LS performed bulk sampling of suspect materials that were included in the report and provided safety recommendations for remediation 2021

SUNY Delhi, Upgrade Building Management Systems– Various Buildings, Delhi, NY - RE&LS conducted a Pre-Renovation Asbestos Survey/Inspection and Lead Paint Survey have been completed at ten campus buildings at SUNY Delhi. RE&LS provided the results in a report for each of the buildings to be impacted by the proposed renovation. RE&LS prepared Asbestos Abatement Design documents, including, plans and specifications for the renovation project and provided Construction Administration Services throughout the execution of the renovation.

Browncroft Community Church, Rochester, NY - The Church was planning major updates and renovations throughout the facility. RE&LS was retained by the Church to perform a hazardous material survey, creation of design documents and specifications, and provide project and air monitoring services as required by 12 NYCRR Part 56. The project involved replacement of all exterior windows, debris clean-up, floor tile removal and pipe insulation removal throughout. RE&LS worked closely with the architect, general contractor and abatement contractor to ensure that all work was completed in a timely and efficient manner.

Re: Limited Phase II Environmental Site Assessment Report
631 Northland Avenue
Buffalo, New York

Dear Ms. Colvin:

Ravi Engineering & Land Surveying, P .C. (RE&LS) conducted additional surficial soil sampling to supplement our Limited Phase II Environmental Site Assessment (ESA) of 631 Northland Avenue, Erie County, Buffalo, New York (the "Site") (Figure 1). This report has been prepared to summarize field activities and observations, and analytical data of soil samples.

BACKGROUND

The subject site is an approximately 2.63-acre parcel on the south side of Northland Avenue in the City of Buffalo, New York (the "Site"). It was reportedly developed in 1953 in association with the Niagara Machine & Tool metal fabricating plant historically located on the eastern adjacent property at 683 Northland Avenue. It operated as a metal fabricating plant under the name Clearing Niagara, and has been vacant since operations ceased in 1992.

RE&LS performed a Phase I ESA in February 2024, and identified the use of the Site and adjacent properties for manufacturing of machinery and sheet metal, household and automotive polish, liquid and cement, electric control panels, and printed circuit boards as a Recognized Environmental Conditions (RECs). Additional investigation was recommended to determine if existing conditions at the Site meet the criteria necessary to enter into the New York State Department of Environmental Conservation (NYSDEC) Brownfield Cleanup Program.

Prior to conducting the Limited Phase II ESA, RE&LS reviewed a 2015 Phase II ESA report prepared by Fisher Associates. Fisher's Phase II was conducted at 631, 683, 741, and 777 Northland Avenue. Soil borings were installed within the subject building and around the eastern and western perimeter of the building as well as on the referenced adjacent properties. One soil sample exhibited exceedances of Benzo(a)pyrene and arsenic above the Industrial Use Soil Cleanup Objective (SCO) at the southeastern portion of the Site. No groundwater samples were collected at the Site.

The results of our Limited Phase II ESA determined that metals detected in three of the four soil samples were at concentrations below 6 NYCRR Part 375 Unrestricted Use SCO. With the exception of arsenic, all concentrations were below the Commercial Use SCO. The arsenic concentration exceeds all Part 375 Restricted Use SCOs.

Two petroleum-related VOCs (m,p-Xylene and methylcyclohexane) were detected in one soil sample, and one solvent-related VOC (trichloroethene) was detected in one soil sample. None of the detections exceed Unrestricted Use SCOs. One SVOC was detected in one soil sample. The concentration is above the Unrestricted Use SCO, but is below the Commercial Use SCO.

PCB-1254 was detected in two soil samples near the southeastern corner of the building above. The concentrations are above the Unrestricted Use SCO, but below the Commercial Use SCO.

Three bedrock wells were installed in April 2024. Groundwater was sampled and analyzed for TCL and CP51 VOCs and CP51 SVOCs. There were no analytes detected in any of the groundwater samples.

METHODOLOGY

Surficial Soil Sampling

RE&LS conducted a surficial soil investigation on August 20, 2024. Fourteen surficial soil samples (SS-1 through SS-14) were collected around the western exterior of the building and southern property boundary (Figure 1). Asphalt, where present, was first cut to expose the soils beneath. A four inch diameter hand auger was then used to bore down to a depth of between six to thirteen inches below ground surface (bgs) for sample collection. Soil samples were screened for volatile organic compounds (VOCs) with a photoionization detector (PID) for evidence of petroleum impacts.

One proposed fifteenth soil sample was attempted to be collected beneath a steel girder in the pit of the interior furnace. A nearly impenetrable layer of steel and cast iron was encountered at the bottom of the furnace pit, and the sample location was abandoned after multiple attempts were made to create an opening within which to expose the soils for sample collection.

Fourteen (14) soil samples were submitted and analyzed by Paradigm Environmental Services, Inc. (Paradigm) for New York State Department of Environmental Conservation (NYSDEC) Target Compound List (TCL) semivolatile organic compounds (SVOCs) by Method 8270, Target Analyte List (TAL) metals by Methods 7471B and 6010C, and polychlorinated biphenyls (PCB) by Method 8082A. Paradigm's Laboratory Analytical reports are provided as Attachment A.

Based on the current zoning of the Site for light industrial use, soil analytical results were compared to 6 NYCRR Part 375 Restricted Use Soil Cleanup Objectives for Commercial and Industrial Use.

RESULTS

Soil Screening Results

Soil borings generally consist of crush and run gravel directly below the asphalt, with sandy loam grading to clay loam with depth. No evidence of impacts, ie odors, staining, or PID readings that would indicate petroleum contamination were noted.

SOIL Analytical Results

TAL Metals

Metals were detected in four of the fourteen soil samples at concentrations above 6 NYCRR Part 375 Commercial Use SCOs (Table 1).

- Seven of the fourteen samples reported concentrations of metals that exceed the Unrestricted Use SCOs.
- SS-1 has a concentration of manganese that exceeds the Industrial Use SCO.
- SS-7 has a concentration of arsenic that exceeds the Industrial Use SCO.
- SS-9 and SS-10 have concentrations of copper that exceed Commercial Use SCOs.

SVOCs

Several SVOCs were detected in multiple locations along the southern boundary of the property and in proximity to the exterior furnace.

- Benzo (a) anthracene was detected at concentrations above the Industrial Use SCOs in sample SS-3. Concentrations exceeded Commercials Use SCOs in sample SS-1 and SS-4.
- Benzo (a) pyrene was detected at concentrations above the Industrial Use SCOs in nine soil samples (SS-1, SS-2, SS-3, SS-4, SS-7, SS-9, SS-10, SS-11, and SS-14).
- Benzo (b) fluoranthene was detected at concentrations above the Industrial Use SCOs in sample SS-3. Concentrations exceeded Commercials Use SCOs in four soil samples (SS-1, SS-4, SS-7, and SS-10)
- Dibenz (a,h) anthracene was detected at concentrations above the Industrial Use SCOs in six soil samples (SS-1, SS-3, SS-4, SS-7, SS-9, and SS-10). Concentrations exceeded Commercials Use SCOs in sample SS-2.
- Indeno (1,2,3-cd) pyrene was detected at concentrations above the Industrial Use SCOs in soil samples SS-3. Concentrations exceeded Commercials Use SCOs in soil samples SS-1 and SS-9.

PCBs

PCB-1254 was detected in six soil samples (SS-1, SS-3, SS-4, SS-9, SS-10, and SS-12) and PCB-1248 was detected in two soil samples (SS-1 and SS-4). The concentrations are above the Unrestricted Use SCOs, but below the Commercial Use SCOs.

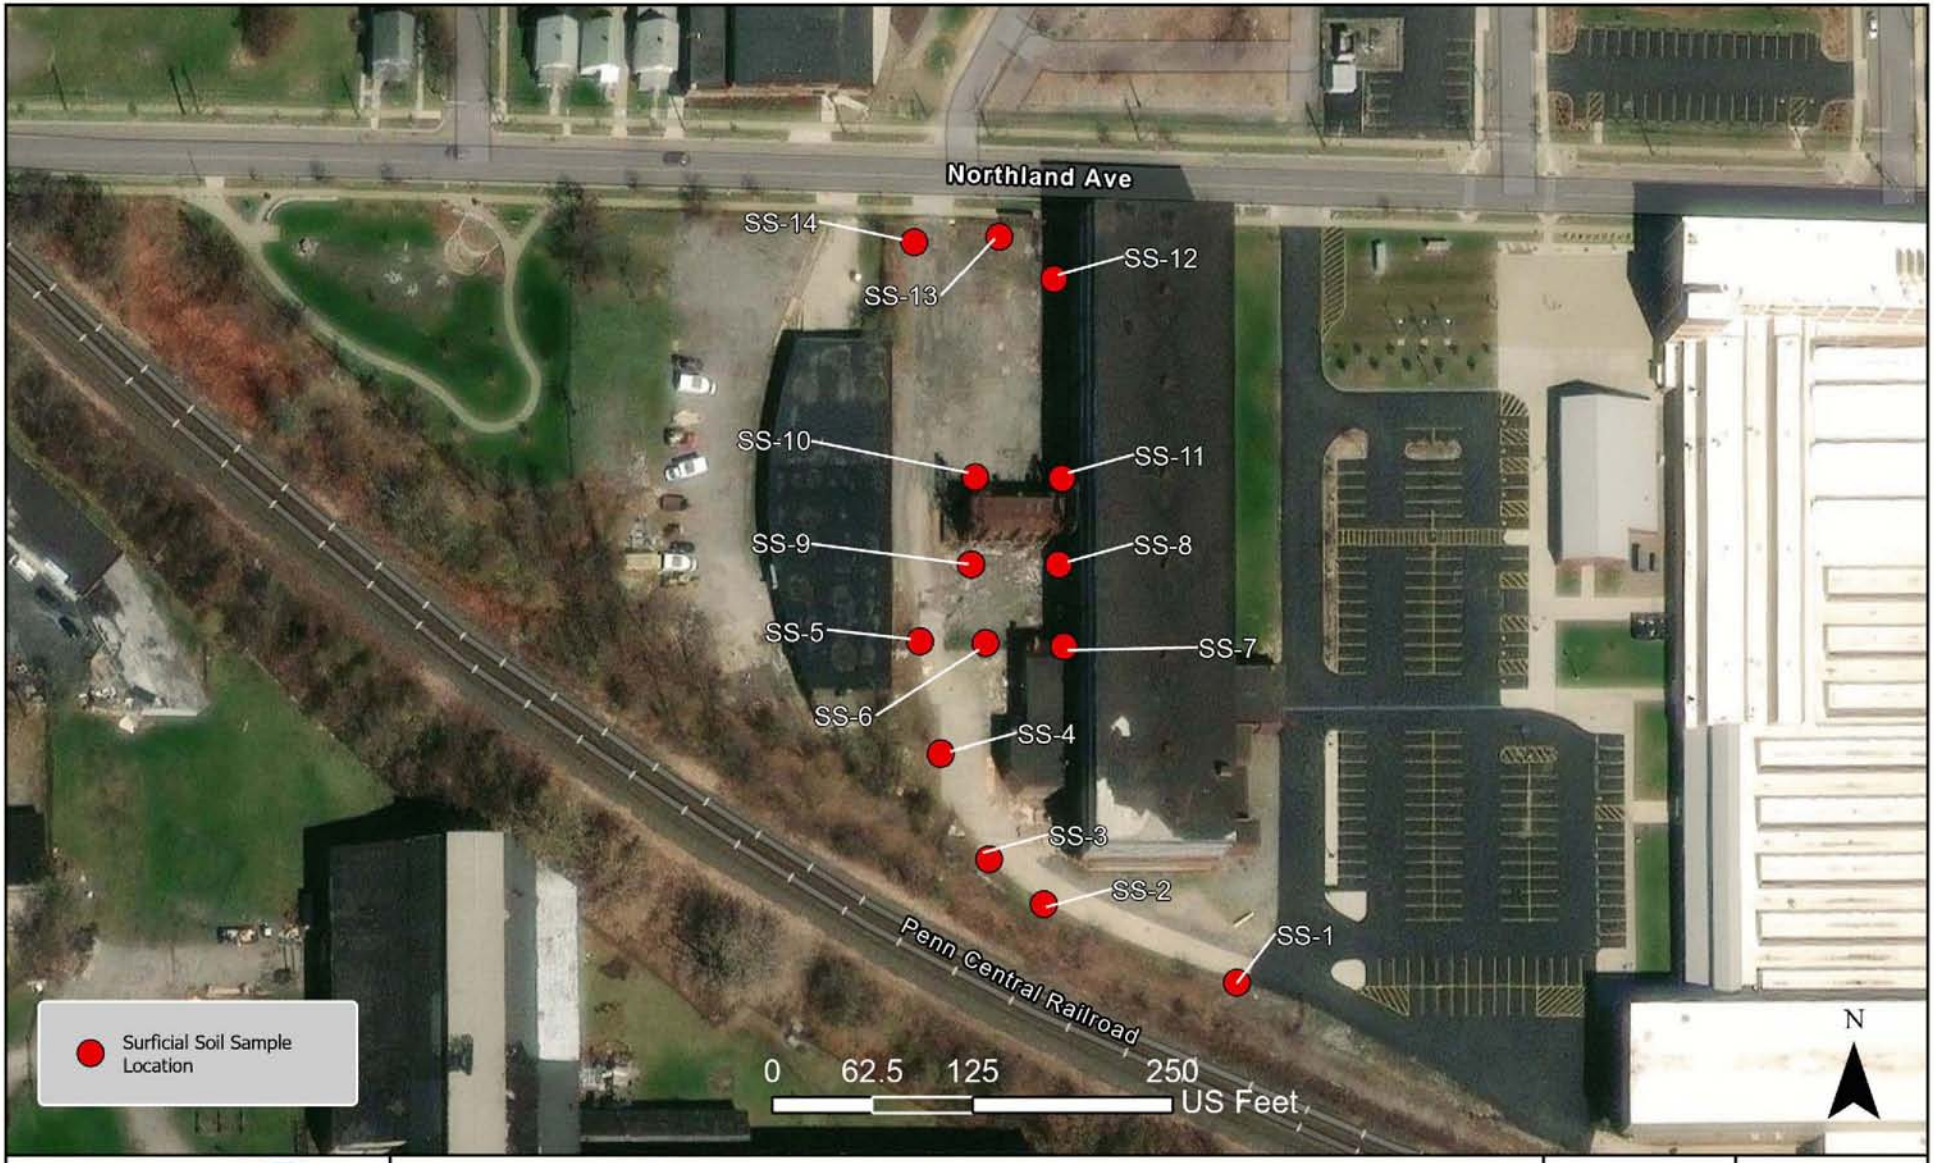
Paradigm's Laboratory Analytical Reports are included as Attachment A.

CONCLUSIONS AND RECOMMENDATION

Soil at the southern portion of the Site and in proximity to the exterior furnace are impacted with SVOCs and TAL metals above Industrial and Commercial Use SCOs.

Based on these and previous Phase II results, we recommend completing the NYSDEC Brownfield Cleanup Program (BCP) Pre-Application Worksheet and submitting it to the Region 9 Environmental Remediation Division of the NYSDEC to determine if environmental site conditions meet the criteria for inclusion in the BCP.

Sincerely,



Lynn Zicari

Environmental Project Manager

Analytical Report For

Ravi Engineering & Land Surveying, P.C.

For Lab Project ID

243844

Referencing

631 Northland Ave

Prepared

Friday, August 30, 2024

Any noncompliant QC parameters or other notes impacting data interpretation are flagged or documented on the final report or are noted below.

Emily Hamer

Certifies that this report has been approved by the Technical Director or Designee

179 Lake Avenue • Rochester, NY 14608 • (585) 647-2530 • Fax (585) 647-3311 • ELAP ID# 10958

This report is part of a multipage document and should only be evaluated in its entirety. The Chain of Custody provides additional sample information, including compliance with the sample condition requirements upon receipt.

Report Prepared Thursday, August 29, 2024

PARADIGM
ENVIRONMENTAL SERVICES, INC.

Analytical Report Appendix

The reported results relate only to the samples as they have been received by the laboratory.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Low level Volatiles blank reports for soil/solid matrix are based on a nominal 5 gram weight. Sample results and reporting limits are based on actual weight, which may be more or less than 5 grams.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified. Aliquots separated for certain tests, such as TCLP, are indicated on the Chain of Custody and final reports with an "A" suffix.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of analyte-specific, frequently used data flags and their meaning:

"<" = Analyzed for but not detected at or above the quantitation limit.
"E" = Result has been estimated, calibration limit exceeded.
"H" = Denotes a parameter analyzed outside of holding time.
"Z" = See case narrative.
"D" = Sample, Laboratory Control Sample, or Matrix Spike Duplicate results above Relative Percent Difference limit.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.
"J" = Result estimated between the quantitation limit and half the quantitation limit.
"L" = Laboratory Control Sample recovery outside accepted QC limits.
"P" = Concentration differs by more than 40% between the primary and secondary analytical columns.
"NC" = Not calculable. Applicable to RPD if sample or duplicate result is non-detect or estimated (see primary report for data flags). Applicable to MS if sample is greater or equal to ten times the spike added. Applicable to sample surrogates or MS if sample dilution is 10x or higher.
"" = Indicates any recoveries outside associated acceptance windows. Surrogate outliers in samples are presumed matrix effects. LCS demonstrates method compliance unless otherwise noted.*
"(1)" = Indicates data from primary column used for QC calculation.
"A" = denotes a parameter for which ELAP does not offer approval as part of their laboratory certification program.
"F" = denotes a parameter for which Paradigm does not carry certification, the results for which should therefore only be used where ELAP certification is not required, such as personal exposure assessment.

GENERAL TERMS AND CONDITIONS
LABORATORY SERVICES

These Terms and Conditions embody the whole agreement of the parties in the absence of a signed and executed contract between the Laboratory (LAB) and Client. They shall supersede all previous communications, representations, or agreements, either verbal or written, between the parties. The LAB specifically rejects all additional, inconsistent, or conflicting terms, whether printed or otherwise set forth in any purchase order or other communication from the Client to the LAB. The invalidity or unenforceability in whole or in part of any provision, term or condition hereof shall not affect in any way the validity or enforceability of the remainder of the Terms and Conditions. No waiver by LAB of any provision, term, or condition hereof or of any breach by or obligation of the Client hereunder shall constitute a waiver of such provision, term, or condition on any other occasion or a waiver of any other breach by or obligation of the Client. This agreement shall be administered and interpreted under the laws of the state which services are procured.

Warranty. Recognizing that the nature of many samples is unknown and that some may contain potentially hazardous components, LAB warrants only that it will perform testing services, obtain findings, and prepare reports in accordance with generally accepted analytical laboratory principles and practices at the time of performance of services. LAB makes no other warranty, express or implied.

Scope and Compensation. LAB agrees to perform the services described in the chain of custody to which these terms and conditions are attached. Unless the parties agree in writing to the contrary, the duties of LAB shall not be construed to exceed the services specifically described. LAB wi use LAB default method for all tests unless specified otherwise on the Work Order.
Payment terms are net 30 days from the date of invoice. All overdue payments are subject to an interest charge of one and one-half percent (1-1/2%) per month or a portion thereof. Client shall also be responsible for costs of collection, including payment of reasonable attorney fees if such expense is incurred. The prices, unless stated, do not include any sale, use or other taxes. Such taxes will be added to invoice prices when required.

Prices. Compensation for services performed will be based on the current Lab Analytical Fee Schedule or on quotations agreed to in writing by the parties. Turnaround time based charges are determined from the time of resolution of all work order questions. Testimony, court appearances or data compilation for legal action will be charged separately. Evaluation and reporting of initial screening runs may incur additional fees.

Limitations of Liability. In the event of any error, omission, or other professional negligence, the sole and exclusive responsibility of LAB shall be to re-perform the deficient work at its own expense and LAB shall have no other liability whatsoever. All claims shall be deemed waived unless made in writing and received by LAB within ninety (90) days following completion of services.
LAB shall have no liability, obligation, or responsibility of any kind for losses, costs, expenses, or other damages (including but not limited to any special, direct, incidental or consequential damages) with respect to LAB's services or results.
All results provided by LAB are strictly for the use of its clients and LAB is in no way responsible for the use of such results by clients or third parties. All reports should be considered in their entirety, and LAB is not responsible for the separation, detachment, or other use of any portion of these reports. Client may not assign the lab report without the written consent of the LAB.
Client covenants and agrees, at its/his/her sole expense, to indemnify, protect, defend, and save harmless the LAB from and against any and all damages, losses, liabilities, obligations, penalties, claims, litigation, demands, defenses, judgments, suits, actions, proceedings, costs, disbursements and/or expenses (including, without limitation attorneys' and experts' fees and disbursements) of any kind whatsoever which may at any time be imposed upon, incurred by or asserted or awarded against client relating to, resulting from or arising out of (a) the breach of this agreement by this client, (b) the negligence of the client in handling, delivering or disclosing any hazardous substance, (c) the violation of the Client of any applicable law, (d) non-compliance by the Client with any environmental permit or (e) a material misrepresentation in disclosing the materials to be tested.

Hazard Disclosure. Client represents and warrants that any sample delivered to LAB will be preceded or accompanied by complete written disclosure of the presence of any hazardous substances known or suspected by Client. Client further warrants that any sample containing any hazardous substance that is to be delivered to LAB will be packaged, labeled, transported, and delivered properly and in accordance with applicable laws.

Sample Handling. Prior to LAB's acceptance of any sample (or after any revocation of acceptance), the entire risk of loss or of damage to such sample remains with Client. Samples are accepted when receipt is acknowledged on chain of custody documentation. In no event will LAB have any responsibility for the action or inaction of any carrier shipping or delivering any sample to or from LAB premises.
Client authorizes LAB to proceed with the analysis of samples as received by the laboratory, recognizing that any samples not in compliance with all current DOH-ELAP-NELAP requirements for containers, preservation or holding time will be noted as such on th final report.
Disposal of hazardous waste samples is the responsibility of the Client. If the Client does not wish such samples returned, LAB may add storage and disposal fees to the final invoice. Maximum storage time for samples is 30 days after completion of analysis unless modified by applicable state or federal laws. Client will be required to give the LAB written instructions concerning disposal of these samples.
LAB reserves the absolute right, exercisable at any time, to refuse to receive delivery of, refuse to accept, or revoke acceptance of any sample, which, in the sole judgment of LAB (a) is of unsuitable volume, (b) may be or become unsuitable for or may pose a risk in handling, transport, or processing for any health, safety, environmental or other reason whether or not due to the presence in the sample of any hazardous substance, and whether or not such presence has been disclosed to LAB by Client or (c) if the condition or sample date make the sample unsuitable for analysis.

Legal Responsibility. LAB is solely responsible for performance of this contract, and no affiliated company, director, officer, employee, or agent shall have any legal responsibility hereunder, whether in contract or tort including negligence.

Assignment. LAB may assign its performance obligations under this contract to other parties, as it deems necessary. LAB shall disclose to Client any assignee (subcontractor) by ELAP ID # on the submitted final report.

Force Majeure. LAB shall have no responsibility or liability to the Client for any failure or delay in performance by LAB, which results in whole or in part from any cause or circumstance beyond the reasonable control of LAB. Such causes and circumstances shall include, but not limited to, acts of God, acts or orders of any government authority, strikes or other labor disputes, natural disasters, accidents, wars, civil disturbances, difficulties or delays in transportation, mail or delivery services, inability to obtain sufficient services or supplies from LAB's usual suppliers, or any other cause beyond LAB's reasonable control.

Law. This contract shall be continued under the laws of the State of New York without regard to its conflicts of laws provision.
